#### Abstract

The reaction of cis- $\left[\mathrm{Cr}([14]-\text { decane })\left(\mathrm{OH}_{2}\right)_{2}\right]^{+}$([14]-decane $=$ rac-5, 5, 7, 12, 12, 14-hexamethyl-1, 4, 8, 11-teraazacyclotetradecane) with $\mathrm{O}-\left\{\mathrm{L}_{\mathrm{a}}\right.$ : chloroacetate (ca), benzoate (bz), $p$-chlorobenzoate (cbz), oxalate (ox), malonate (mal), acetylacetonate (acac), citrate (cit)\} or $\mathrm{N}^{-}\left\{\mathrm{L}_{\mathrm{a}}: \mathrm{NCS}^{-}, \mathrm{N}_{3}{ }^{-}\right\}$bonded auxiliary ligands formed a new cis-[Cr(III)([14]-decane)( $\left.\left.\mathrm{L}_{\mathrm{a}}\right)_{m}\right]^{n+}$ complexes. These complexes have been characterized by a combination of elemental analysis, conductivity, IR and Vis spectroscopy, mass spectrometry, thermogravimetry, and $X-$ ray crystallography. The crystal structures of four complexes were determined by X -ray crystallography. The complexes have been showed a distorted octahedral coordination environment with the macrocycle adopting a folded cis-V conformation. The crystal of cis-[ $\operatorname{Cr}([14]-$ decane $)$ $\left.-(\mathrm{NCS})_{2}\right]_{C l O}^{4} \cdot \mathrm{H}_{2} \mathrm{O}$ was orthorhombic, space group Pbca, with cell constant $a=15.295 \AA, b=16.4850(10) \AA, c=21.0490(10) \AA, \quad \alpha=90^{\circ}, \beta=90^{\circ}$, $\mathrm{v}=90^{\circ}, \quad V=5307.3(4) \AA^{3}$, and $Z=8$. The hexacoordination geometry around $\mathrm{Cr}^{3+}$ ion exhibited a distorted octahedral structure. In this complex Cr (III) was coordinated with the four secondary nitrogen atoms of the macrocycle and two nitrogen atom of two

isothiocyanate in the cis position. The crystal of cis-[Cr([14] -decane)(cbz) $]^{2} \mathrm{ClO}_{4}$ was orthorhombic, space group Pbca, with cell constant $a=12.0930(10) \AA, b=20.3580(10) \AA, c=28.852 \AA, \quad \alpha=90^{\circ}, \beta=90^{\circ}$, $\mathrm{v}=90^{\circ}, \quad V=7103.1(7) \AA^{3}$, and $Z=8$. The hexacoordination geometry around Cr (III) ion was a distorted octahedral in which Cr (III) was coordinated with the four secondary nitrogen atoms of the macrocycle as well as with two oxygen atom of two chlorobezoate in the cis position. The crystal of cis-[Cr([14]-decane)(acac)](ClO()_{2}\). $0.5 \mathrm{H}_{2} \mathrm{O}$ was monoclinic, space group $\mathrm{C} 2 / \mathrm{c}$, with cell constant $a=20.0210(10) \AA, b=30.1120(10) \AA, c=12.708 \AA, \quad a=90^{\circ}, \beta=127.2170(10)^{\circ}$, $\mathrm{v}=90^{\circ}, \quad V=6101.4(4) \AA^{3}$, and $Z=8$. The hexacoordination geometry around Cr (III) ion was a distorted octahedral in which Cr (III) was coordinated with the four secondary nitrogen atoms of the macrocycle as well as with two oxygen atom of bidentated acethylacetone(acac) in the cis position. The crystal of cis- $\left[\{\mathrm{Cr}([14]-\text { decane })(\mu-\mathrm{cit})\}_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ was monoclinic, space group $\mathrm{C} 2 / \mathrm{c}$, with cell constant $a=23.818(2) \AA, \quad b=21.139(2) \AA$, $c=16.1350(10) \AA, \quad a=90^{\circ}, \beta=127.294(4)^{\circ}, \quad \vee=90^{\circ}, \quad V=6462.8(9) \AA^{3}, \quad$ and $Z=8$. The structure of the cation in citrato complex revealed two identical homobinuclear Cr (III) Cr (III) cores joined by two bridging citrato group linkage. The cation was centro-symmetric. The hexacoordination geometry around Cr (III) ion was a distorted octahedral in which Cr (III) was coordinated with the four
secondary nitrogen atoms of the macrocycle as well as with two oxygen atom of two monodentated citrate in the cis position. The distence between two Cr metal ions was $7.360 \AA$. The visible absorption spectra of cis- $\left[\operatorname{Cr}([14]-\text { decane })\left(\mathrm{L}_{\mathrm{a}}\right)_{m}\right]^{n+}$ in DMF solution at room temperature exhibited two bands, at $17400 \sim 18800 \mathrm{~cm}^{-1}\left(\mathrm{v}_{1}\right)$ and $23400 \sim 25900 \mathrm{~cm}^{-1}\left(\mathrm{v}_{2}\right)$, due to the ${ }^{4} A_{2 \mathrm{~g}} \rightarrow{ }^{4} T_{2 \mathrm{~g}}$ and ${ }^{4} A_{2 \mathrm{~g}} \rightarrow{ }^{4} T_{1 \mathrm{~g}}$ $\left(O_{\mathrm{h}}\right)$ transitions, respectively. The FAB mass spectra peaks of all complexes were corresponding to the molecular ion $\left[\operatorname{Cr}([14]-\text { decane })\left(\mathrm{L}_{\mathrm{a}}\right)_{m}\right]^{+} \quad(m=1$ or 2$)$. Thermogravimetry analysis(TGA) for the Cr (III) complexes was found out from the results that the prepared macrocycle compounds have relatively high thermal stability. The macrocyclic entity changed slowly up to $350^{\circ} \mathrm{C}$, and then those complexes have been changed to green $\mathrm{Cr}_{2} \mathrm{O}_{3}$ were observed at over $990^{\circ} \mathrm{C}$.

## I. Introduction

Intensive studies on coordination chemistry of macrocyclic multidentate ligands have led to useful approaches towards ligand design for selective complexation of metal ions. ${ }^{1-3}$ The macrocyclic ligand has two specific properties; ring size effect and macrocyclic effect. The former means that macrocyclic ligand can select the metal ion whose ionic radius fits the ligand cavity size. The latter describes the significant enhancement in complex stability constants in the appropriately fitted macrocyclic ligands compared to their open-chain analogues. ${ }^{4}$, 5 교 중앙도서관

Both the ring size and macrocyclic effect have been extensively examined in the view point of thermodynamics. ${ }^{6-9}$ Selectivity patterns can be tested with the combined effects of (1) metal ion solvation, (2) ligand solvation, and (3) ligand conformation. ${ }^{6,10}$ Thธัm and co-workers have been examined this hole-size selectivity with a nitrogen-donor tetra-aza macrocycle. ${ }^{11}$ The hole-size has been estimated using molecular mechanics calculation for the several macrocyclic ligands. ${ }^{12}$

Among pyridinocrown ethers[1] of different ring sizes (from 15-crown-5 to 33 -crown-11), the ligand with 18 -membered ring exhibits the maximum binding constants for all alkali metal
cations. ${ }^{13}$ Several pyridino macrocycles showed more effective membrane carriers for $\mathrm{Ag}^{+}$than the parent crown ethers. ${ }^{14}$ Kumar, Singh and co-workers synthesized a series of pyridine-containing macrocycles and characterized their metal ion complexation properties. ${ }^{15}$

[1]

Recently the interest in polyazamacrocyclic chelate compounds with paramagnetic and radioactive metal ion has grown considerably, largely due to their biomedical applications such as (1) magnetic resonance imaging(MRI) contrast agents, ${ }^{16,}{ }^{17}$ (2) NMR shift-relaxation probes of the dynamic solution conformation of molecules, (3) shift reagents for NMR-active cations, ${ }^{18}$ and (4) diagnostic and therapeutic radiopharmaceuticals. ${ }^{19}$ Consequently the
investigations of macrocyclic complexes by electrochemical, spectral, structural, kinetic and thermodynamic evaluations has received considerable attention. As a result of these studies, a number of paramagnetic metal chelates are using clinical agents as bioconjugates for monoclonal antibody radioisotope labeling and MRI contrast agents.

[3]

A ligand, DOTA (1, 4, 7, 10-tetraazacyclododecane- $N, N^{\prime}, N^{\prime \prime}$, $N^{\prime \prime \prime}$-tetraacetate)[2], derived from tetraazacyclododecane (cyclen) forms one of the most thermodynamically stable and kinetically inert complexes with the trivalent lanthanide cations. ${ }^{20}$ Due to the positive properties, $[\operatorname{Gd}(\text { DOTA })]^{-}$is one of the most effective and safest MRI contrast enhancement agents. ${ }^{21}$ The complex formed from lanthanide metals and the methylenephosphonate analog, DOTP (1, 4, 7, 10-tetraazacyclododecane- $N, N^{\prime \prime}, N^{\prime \prime}$, $N^{\prime \prime \prime}$-tetrakis(methylene -phosphonate))[3], has also been examined in some detail. ${ }^{22}$ For example, $\mathrm{Tm}^{3+}$ complex, $[\mathrm{Tm}(\mathrm{DOTP})]^{5-}$ is proven to be a versatile ${ }^{23} \mathrm{Na}^{+}$shift agent, for both perfused tissues and in vivo animal studies.

Since the importances of axial coordination in transition metal-macrocyclic complexes in their biological functions, the reactivity of metal complexes toward Lewis base like CO, $N$-methylimidazole has been studied extensively. ${ }^{23,}{ }^{24}$

Studies on the interaction between cyanide anions and $\operatorname{Co}$ (III) complexes are important not only in coordination chemistry but also in toxicology. Because of the high affinity of $\mathrm{CN}^{-}$anions for cobalt complexes, hydroxocobalamin ${ }^{25,26}$ and water-soluble Co (III) porphyrins ${ }^{27}$ have been investigated as an effective antidote to the lethal effects of cyanide anions. The mechanism of the detoxification clearly involves the formation of cyanide complex.

This thesis deals with the syntheses (Scheme 1), characterization and crystal structures of cis-[Cr(III)([14]-decane)( $\left.\left.\mathrm{L}_{\mathrm{a}}\right)_{m}\right]^{n+}$ ([14]-decane ; 5, 5, 7, 12, 12, 14-hexamethyl-1, 4, 8, 11-tetraazacyclotetradecane) complexes containing $\mathrm{O}-$ or N -bonded auxiliary ligands $\left\{\mathrm{L}_{\mathrm{a}}: \mathrm{NCS}^{-}\right.$, $\mathrm{N}_{3}{ }^{-}$, chloroacetate (ca ; $\mathrm{ClCH}_{2} \mathrm{COO}^{-}$), benzoate (bz ; $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COO}^{-}$), $p$-chlorobenzoate ( $\mathrm{cbz} ; \mathrm{ClC}_{6} \mathrm{H}_{4} \mathrm{COO}^{-}$), oxalate (ox ; ${ }^{-} \mathrm{OOCCOO}^{-}$), malonate (mal ; ${ }^{-} \mathrm{OOCCH}_{2} \mathrm{COO}^{-}$), acetylacetonate (acac ; $\mathrm{CH}_{3} \mathrm{COCHCOCH}_{3}{ }^{-}$), citrate (cit ; ${ }^{-} \mathrm{OOCCH}_{2} \mathrm{C}(\mathrm{OH})\left(\mathrm{COO}^{-}\right) \mathrm{CH}_{2} \mathrm{COOH}$ ), \} at the cis positions.

Scheme 1. Syntheses of the $\operatorname{cis}-\left[\operatorname{Cr}([14]-\text { decane })\left(\mathrm{L}_{\mathrm{a}}\right)_{m}\right]^{n+}(m, n: 1$ or 2$)$.

## II. Experimental Section

## 1. Materials

In synthesis of macrocyclic ligand, ethylenediamine, acetone, $\mathrm{HClO}_{4}, \mathrm{NaOH}$ and $\mathrm{NaBH}_{4}$ purchased from by Junsei Chemical Co without further purification. All other materials and solvents in synthesis of complexes were used as purchased from Aldrich-Sigma or Fisher. rac-[14]-Decane macrocyclic ligand, cis- $-\mathrm{Cr}([14]-$ decane $\left.)(\mathrm{Cl})_{2}\right] \mathrm{Cl}$ and $\mathrm{cis}^{-}$- $\mathrm{Cr}([14]-$ decane $\left.)(\mathrm{OH})_{2}\right]^{+}$solution were prepared according to the literatures. ${ }^{28,} 29$

## 2. Physical Measurements

Microanalyses of $\mathrm{C}, \mathrm{H}$, and N were carried out using LECO CHN-900 analyzer. The electronic absorption spectra of the complexes were acquired $700-300 \mathrm{~nm}$ at $25^{\circ} \mathrm{C}$ by using a HP model 8453 UV-VIS spectrophotometer. The measurement sample of complexes were prepared with DMF and a matched pair of Teflon stopped quartz cells were used. Conductivity measurements of the complexes were carried out at $25 \pm 1{ }^{\circ} \mathrm{C}$ in DMF using an ORION 162 conductivity temperature meter. IR spectra were recorded on a Bruker FSS66-FT-IR spectrometer in the range $4000-370 \mathrm{~cm}^{-1}$ using KBr pellets. FAB -mass spectra were obtained on a JEOL JMS-700 mass spectrometer ( $6 \mathrm{kV}, 10 \mathrm{~mA}$ ) using argon as the FAB gas. The accelerating voltage was 10 kV and spectra were recorded at room temperature. Glycerol was used as the matrix. The mass spectrometer was operated in positive ion mode, and mass spectum was calibrated by Alkali-CsI positive. TGA were carried out on a TGA 2050 thermal analyzer. The thermogravimetric curves of complexes were recorded in $30 \sim 100$ $0^{\circ} \mathrm{C}$ range in nitrogen atmosphere. The heating rate was $5^{\circ} \mathrm{C} / \mathrm{min}$, but $1^{\circ} \mathrm{C} / \mathrm{min}$ in $250 \sim 350^{\circ} \mathrm{C}$ range.

## 3. Synthesis of Ligands

1) 5, 5, 7, 12, 12, 14-Hexamethyl-1, 4, 8, 11-tetraazacyclotetradeca-4, 11-diene (trans-[14]-diene) diperchlorate

Ethylenediamine ( $2.03 \mathrm{~mL}, 30 \mathrm{mmol}$ ) and concentrated $\mathrm{HClO}_{4}$ $(8.16 \mathrm{~mL}, 75 \mathrm{mmol})$ were added dropwise in aceton ( 45 mL ). The mixture was heated at $45^{\circ} \mathrm{C}$ with stirring for ca. 30min. Afterwards ethylenediamine ( $2.03 \mathrm{~mL}, 30 \mathrm{mmol}$ ) and 45 mL acetone were added into the mixture then heated at $45^{\circ} \mathrm{C}$ with stirring for ca. 24 h . The mixture was cooled to room temperature. The white precipitate was removed by filteration, washed with ice-cold acetone, then dried under vacuum.

Yield 71\%.

2) 5, 5, 7, 12, 12, 14-hexamethyl-1, 4, 8, 11-tetraazacyclotetra -decane(rac-[14]-decane)
trans-[14]-Diene diperchlorate (10 g, 21 mmol ) was dissolved in methanol ( 50 mL ). Sodium borohydride ( $1.9 \mathrm{~g}, 63 \mathrm{mmol}$ ) and sodium hydroxide ( $1.65 \mathrm{~g}, 40 \mathrm{mmol}$ ) were added alternatively in small portions to warmed solution for 1 h . The solution was stirred at room temperature for 1 h , and refluxed for 15 min . Sodium hydroxide aqueous solution( 5 g in 100 mL water) was added in the solution, and stirred for 1 h . The white precipitate was removed by filteration and washed with ice-cold water then dried under vacuum.

The methanol(ca. 60 mL ) solution was refluxed until all precipitate dissolved. The resulting solution was filtered off when it was hot. The filtrate was added into water ( 40 mL ), and cooled in ice-bath. Fine crystals of meso-[14]-decane were slowly formed. The product was removed by filteration and washed with water.

Potassium hydroxide (ca. 10 g ) was added to the remained aqueous filtrate of the previous procedure with stirring. The
product (rac-[14]-decane) was removed by filteration and recrystallised from dry ether then dried under vacuum.

Yield 2.10 g (33\%).

## 4. Synthesis of Complexes

1) cis $-\left[\mathrm{Cr}([14]\right.$-decane $\left.)(\mathrm{Cl})_{2}\right] \mathrm{Cl}$
cis $-\left[\mathrm{Cr}([14]\right.$-decane $\left.)(\mathrm{Cl})_{2}\right] \mathrm{Cl}$ complex was prepared by the reaction of $\mathrm{CrCl}_{3}, \mathrm{Zn}$ powder, and $\mathrm{rac}-5,5,7,12,12,14-$ hexamethyl -1, 4, 8, 11-tetraazacyclotetradecane(rac-[14]-decane) hydrate according to the literature. $\mathrm{CrCl}_{3}(10 \mathrm{~g})$ was dissolved in 50 mL N -methyl
-formamide with Zn powder (ca. 10 mg ). The rac-[14]-decane ligand ( 18 g ) was added into the resulting solution, then refluxed for 2 h . A bluish-green precipitate was slowly formed during this treatment. The resulting mixture was cooled in ice-bath. The precipitate was removed by filteration and washed twice with cold-water and ethanol then dried under vacuum.

Anal. Calcd (Found, \%) $\mathrm{C}_{16} \mathrm{H}_{38} \mathrm{~N}_{4} \mathrm{Cl}_{3} \mathrm{Cr}$ (442.35)
C, 43.40 (43.60) : H, 8.14 (8.30) : N, 12.66 (12.51).
2) cis $-\left[\mathrm{Cr}([14]-\text { decane })(\mathrm{OH})_{2}\right]^{+}$solution

## 제주대학교 중앙도서관

cis- $\left[\mathrm{Cr}([14] \text {-decane })(\mathrm{OH})_{2}\right]^{+}$solution was prepared by dissolving cis $-\left[\mathrm{Cr}([14]\right.$-decane $\left.)(\mathrm{Cl})_{2}\right] \mathrm{Cl}$ in NaOH aqueous solution according to the literatures. cis $-\left[\mathrm{Cr}([14]-\right.$ decane $\left.)(\mathrm{Cl})_{2}\right] \mathrm{Cl}(10 \mathrm{~g})$ was dissolved in the NaOH aqueous solution ( 4 g NaOH in 100 mL water) at $100^{\circ} \mathrm{C}$. The resulting blue-colored solution was cooled to room temperature and filtered off the residues of undissolved material. This solution was as the starting material for the following preparations.
3) cis- $\left[\mathrm{Cr}([14]\right.$-decane $\left.)(\mathrm{OH})_{2}\right] \mathrm{ClO}_{4} \cdot 3 \mathrm{H}_{2} \mathrm{O}$

The saturated $\mathrm{NaClO}_{4}$ solution ( 2 mL ) was slowly added to
cis $-\left[\mathrm{Cr}([14]-\text { decane })(\mathrm{OH})_{2}\right]^{+}$solution ( $2 \mathrm{mmol}, 10 \mathrm{~mL}$ ). The mixture was stirred 1 h , then cooled in ice bath. The bluish-black crystals were removed by filteration and washed twice with ice-cold acetone quickly, then dried under vacuum.

Yield 78\%.
Anal. Calcd (Found, \%) $\mathrm{C}_{16} \mathrm{H}_{38} \mathrm{~N}_{4} \mathrm{O}_{6} \mathrm{ClCr} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ (Fw. 523.99)

## 5. X-ray Diffraction Measurements

1) X -ray diffraction of cis- $\left[\mathrm{Cr}([14]-\right.$ decane $\left.)(\mathrm{NCS})_{2}\right] \mathrm{ClO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$

The single crystal of cis-[Cr([14]-decane) $\left(\mathrm{NCS}_{2}\right] \mathrm{ClO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$ suitable for structure determination was acquired from acetonitrile and $\mathrm{H}_{2} \mathrm{O}(1: 1 \mathrm{v} / \mathrm{v})$ mixed solvent, by slow evaporation of solvent at room temperature. The essential experimental conditions for the crystal structure determination and resulting crystal data were summarized in Table 1, and atomic coordinates were given in Table 2. The single crystal of cis $-\left[\operatorname{Cr}([14]-\right.$ decane $)\left(\mathrm{NCS}_{2}\right] \mathrm{ClO}_{4}$. $\mathrm{H}_{2} \mathrm{O}$ was mounted on a glass fiber and coated with epoxy resin. X-ray data were collected at room temperature using graphite-monochromated Mo $K_{a}$ radiation on a Kappa CCD diffractometer. Data were corrected for Lorentz and polarization effects. Absorption correction was not made. For cis $-\left[\mathrm{Cr}([14]\right.$-decane $\left.)(\mathrm{NCS})_{2}\right] \mathrm{ClO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$, among 6039 reflections measured in the range $1.41 \leq 2 \theta \leq 27.45,6030$ were assumed to be observed $(F>4 \sigma(F))$. The crystal structure was solved by the direct method, and refined by full-matrix least-squares refinement using the SHELXL-97 computer program. ${ }^{30}$ All non-hydrogen atoms were refined anisotropically. The positions of all hydrogen atoms were allowed to ride on their bonded atoms with the
isotropic displacement factors fixed with values of 1.2 times those of the bonded atoms.

$U(\mathrm{eq})$ was defined as one third of the trace of the orthogonalized $U_{i j}$ tensor.
4) X -ray diffraction of cis- $\left[\{\mathrm{Cr}([14]-\text { decane })(\mu-\text { cit })\}_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$

The single crystal of cis $-\left[\{\mathrm{Cr}([14]-\text { decane })(\mu-\mathrm{cit})\}_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ suitable for structure determination was acqured from acetonitrile and $\mathrm{H}_{2} \mathrm{O}(1: 1 \mathrm{v} / \mathrm{v})$ mixture solvent, by slow evaporation of solvent at room temperature. The essential experimental conditions for the crystal structure determination and resulting crystal data were summarized in Table 7, and atomic coordinates were given in Table 8. The single crystal of cis-[\{Cr([14]-decane) $(\mu-$ cit $\left.)\}_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$. $6 \mathrm{H}_{2} \mathrm{O}$ was mounted on a glass fiber and coated with epoxy resin. X-ray data were collected at room temperature using graphite-monochromated $\mathrm{Mo} \mathrm{K}_{\text {a }}$ radiation on a Kappa CCD diffractometer. Data were corrected for Lorentz and polarization effects. Absorption correction was not made. For cis- $-\left[\{\mathrm{Cr}([14]-\text { decane })(\mu-\mathrm{cit})\}_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$, among 2897 reflections measured in the range $1.35 \leq 2 \theta \leq 27.48,2891$ were assumed to be observed $(F>4 \sigma(F))$. The crystal structure was solved by the direct method, and refined by full-matrix least-squares refinement using the SHELXL-97 computer program. ${ }^{30}$ All non-hydrogen atoms were refined anisotropically. The positions of all hydrogen atoms were allowed to ride on their bonded atoms with the isotropic displacement factors fixed with values of 1.2 times those of the bonded atoms.

## III. Results and Discussion

## 1. Properties of the Spectrum cis- $\left[\mathrm{Cr}([14]-\text { decane })(\mathrm{OH})_{2}\right]^{+}$Solution

The structure of cis $-\left[\mathrm{Cr}([14]-\text { decane })(\mathrm{OH})_{2}\right]^{+}$cation ${ }^{29}$ was shown in Fig. 1. The aqueous solution of the compound behaves as a divalent base. From the acid dissociation constants (Table 9) ${ }^{29}$ it is known that the cis-[Cr([14]-decane) $\left.\left(\mathrm{OH}_{2}\right)_{2}\right]^{3+}$ cation is a stronger acid than a number of other cis-tetraaminediaquachromium(III) cation.

Table 9. Acid Dissociation Constants for Some cis-Tetraamine -diaquachromium(III) Complexes at 298 K in $1.0 \mathrm{M} \mathrm{NaClO}_{4}$ Solution.

Fig. 1. Configuration of the cis $-\left[\mathrm{Cr}([14]-\text { decane })(\mathrm{OH})_{2}\right]^{+}$cation. ${ }^{29}$ 8 제주대학교 중앙도서관
All specta are characterized by an increased intensity and a red-shift of a absorption bands compared to other cis-tetraamine -diaquachromium(III) complexes. ${ }^{29}$ As shown in Fig. 1 a pronounced octahedral distortion of the $\mathrm{CrN}_{4} \mathrm{O}_{2}$ apparently induced by two methyl groups above and below the $\mathrm{CrN}_{2} \mathrm{O}_{2}$ plane. Visible absorption spectra of cis $-\left[\mathrm{Cr}([14]-\text { decane })(\mathrm{OH})_{2}\right]^{+}$solution were measured by controlling pH with $\mathrm{HClO}_{4}$. The spectral characteristics of cis- $\left[\mathrm{Cr}([14] \text {-decane })(\mathrm{OH})_{2}\right]^{+}$, cis- $-\left[\mathrm{Cr}([14] \text {-decane })(\mathrm{OH})\left(\mathrm{H}_{2} \mathrm{O}\right)\right]^{2+}$ and cis $-\left[\mathrm{Cr}([14] \text {-decane })\left(\mathrm{OH}_{2}\right)_{2}\right]^{3+}$ were illustrated in Fig. 2.

Fig. 2. Visible absorption spectra of cis $-\left[\mathrm{Cr}([14]-\text { decane })(\mathrm{OH})_{2}\right]^{+}$ complex and its protonated species.

## 2. Absorption Spectroscopy

The visible absorption spectra of cis- $\operatorname{Cr}([14]-$ decane $\left.)\left(\mathrm{L}_{\mathrm{a}}\right)_{m}\right]^{n+}\left(\mathrm{L}_{\mathrm{a}}\right.$ : $\mathrm{NCS}^{-}, \mathrm{N}_{3}{ }^{-}$, chloroacetate, benzoate, $p$-chlorobenzoate, oxalate, malonate, acetylacetonate, citrate) in DMF solution at room temperature were represented in Fig. 3~11 and summarized Table 10. As shown Fig. $3 \sim 11$ and Table 10 the spectra exhibited two bands, at $17400 \sim 18800 \mathrm{~cm}^{-1}\left(\mathrm{v}_{1}\right)$ and $23400 \sim 25900 \mathrm{~cm}^{-1}\left(\mathrm{v}_{2}\right)$, due to the ${ }^{4} A_{2 \mathrm{~g}} \rightarrow{ }^{4} T_{2 \mathrm{~g}}$ and ${ }^{4} A_{2 \mathrm{~g}} \rightarrow{ }^{4} T_{1 \mathrm{~g}}\left(O_{\mathrm{h}}\right)$ transitions, respectively. The assignment of geometric configuration is suggested by inspection of the $d-d$ absorption spectra. The position and the number of the spin-allowed transitions in the electronic spectra, and their molar absorption coefficients are usually reliable indicators for distinguishing the cis and trans isomers. In general, the less symmetrical cis chromium(III) complexes have two bands in the visible region, and these bands are at higher energies and have higher extinction coefficients than those of more symmetrical trans-isomers. ${ }^{31}$ As shown in Table 11, the more symmetrical trans-isomers of $\left[\mathrm{CrN}_{4} \mathrm{Cl}_{2}\right]^{+}$chromophores normally have extinction coefficients of $<30$ and the lowest energy $d-d$ band $\left({ }^{4} A_{2 g} \rightarrow{ }^{4} T_{2 g}\right)$ occurs in the range of $16600 \sim 17500 \mathrm{~cm}^{-1}$. The less symmetrical cis-isomers have much higher extinction coefficients (ca. 70~120
$\mathrm{M}^{-1} \mathrm{~cm}^{-1}$ ) and lowest energy $d-d$ band occurred in the region of $18900 \sim 20700 \mathrm{~cm}^{-1}$. In these complexes, the nearly symmetric profiles of two quartet bands and the higher extinction coefficient of $134 \sim 223 \mathrm{M}^{-1} \mathrm{~cm}^{-1}$ were evidences of the cis configuration. A chromium complexes in tetragonal symmetry are expected to have four absorption bands in $d-d$ region, but each spectrum apparently has two major components. For the splitting of the two bands, we have fitted the band profiles to four or five Gaussian curves, as shown in Fig. 3~11. The contribution from outside bands was corrected for fine deconvolution. The four peak positions can be assigned to the ${ }^{4} E\left({ }^{4} T_{2 \mathrm{~g}}\right.$ in $O_{h}$ symmetry), ${ }^{4} \boldsymbol{B}_{2}\left({ }^{4} T_{2 \mathrm{~g}}\right),{ }^{4} \boldsymbol{E}\left({ }^{4} T_{1 \mathrm{~g}}\right)$ and ${ }^{4} A_{2}\left({ }^{4} T_{1 \mathrm{~g}}\right)$, respectively, as shown in Table $12 \cdot \frac{36,}{}{ }^{37}$

## 3. Infrared Spectroscopy

The mid-infrared spectra of the nine complexes recorded at room temperature were presented in Fig. $12 \sim 20$, and summarized at Table 13. The broadness of absorption bands near $3400 \mathrm{~cm}^{-1}$ indicated that there were hydrogen bonds in these complexes. Two strong bands in the region of $3300 \sim 3050 \mathrm{~cm}^{-1}$ were due to the symmetric and antisymmetric $\mathrm{N}-\mathrm{H}$ stretching modes. Two strong bands in the region of $2990 \sim 2860 \mathrm{~cm}^{-1}$ were due to the symmetric and antisymmetric $\mathrm{C}-\mathrm{H}$ stretching modes. The $\mathrm{N}-\mathrm{H}$ wagging mode appeared at near $1250 \mathrm{~cm}^{-1}$ as a medium band. The very strong absorption at near $1100 \mathrm{~cm}^{-1}$ and near 620 $\mathrm{cm}^{-1}$ were assigned to ionic perchlorate. ${ }^{37}$ Two peaks at near 440 and near $480 \mathrm{~cm}^{-1}$ were assigned to the $\mathrm{Cr}-\mathrm{N}$ stretching mode. ${ }^{38,39}$ Frequently, the infrared spectroscopy is useful in elucidating structures and determining the number of functional groups involved in coordination. It is well known that cis isomer of cyclam chromium(III) complexes exhibits at least three bands in the $900 \sim 830 \mathrm{~cm}^{-1}$ region due to the $\mathrm{N}-\mathrm{H}$ rocking modes, while the methylene vibrational modes exhibit two peaks in the $830 \sim 770$ $\mathrm{cm}^{-1}$ region. However, trans isomer shows two groups of bands; a doublet near $890 \mathrm{~cm}^{-1}$ arises from the secondary amine vibration
and only one band near $810 \mathrm{~cm}^{-1}$ is mainly due to the methylene vibration. ${ }^{40}$ The present complexes exhibited three $\mathrm{N}-\mathrm{H}$ wagging bands at near 890 , near 860 and near $840 \mathrm{~cm}^{-1}$ region. Two $\mathrm{CH}_{2}$ rocking bands were exhibited at near 820 and near $780 \mathrm{~cm}^{-1}$. Since the infrared spectra of the title complexes were consistent with the cis configuration.

The IR spectra of the cis $-\left[\mathrm{Cr}([14]\right.$-decane $)\left(\mathrm{NCS}_{2}\right] \mathrm{ClO}_{4}$ complex revealed that the ambidentate thiocyanate ligand was N -bonded ${ }^{41,42}$ (the v (C-S) vibration occurred $818 \mathrm{~cm}^{-1}$ and the strong $\mathrm{v}(\mathrm{N}-\mathrm{C})$ vibration occurred $2073 \mathrm{~cm}^{-1}$ ). In general, the transition metal complexes containing a terminal azide ligand exhibit an intense antisymmetric friquency, 不能 $\bar{o}\left(\mathrm{~N}_{3}\right)$ 중 at near $2090 \mathrm{~cm}^{-1}$ and a symmetric mode, $v_{\mathrm{s}}\left(\mathrm{N}_{3}\right)$ at $\sim 1350 \mathrm{~cm}^{-1}$ and deformation band at near $620 \mathrm{~cm}^{-1} .^{43}$ The IR spectra of the cis-[Cr([14]-decane) $\left.\left(\mathrm{N}_{3}\right)_{2}\right]$ $-\mathrm{ClO}_{4}$ complex at $2081 \mathrm{~cm}^{-1}$ were assigned as the antisymmetric stretching mode of azide. The $\mathrm{v}_{\mathrm{s}}\left(\mathrm{N}_{3}\right)$ stretching frequency and $\delta$ $\left(\mathrm{N}_{3}\right)$ deformation band were observed at 1344 and $636 \mathrm{~cm}^{-1}$ respectively.

Two stretching frequencies $\mathrm{v}_{\mathrm{as}}\left(\mathrm{COO}^{-}\right)$and $\mathrm{v}_{\mathrm{s}}\left(\mathrm{COO}^{-}\right)$found at near 1600 and near $1350 \mathrm{~cm}^{-1}$ revealed that the carboxylate oxygen was coordinated. ${ }^{37}$ Unidentate carboxylate complexes have much greater $\Delta v$ [between $v_{a s}\left(\mathrm{COO}^{-}\right)$and $\mathrm{v}_{\mathrm{s}}\left(\mathrm{COO}^{-}\right)$] values than the ionic compounds. Since there were large $\Delta v$ values (oxalate: $296 \mathrm{~cm}^{-1}$,
malonate: $296 \mathrm{~cm}^{-1}$, bezonate: $242 \mathrm{~cm}^{-1}$, p-chlorobezonate: 257 $\mathrm{cm}^{-1}$, chloroacetate : $338 \mathrm{~cm}^{-1}$, citratate: $230 \mathrm{~cm}^{-1}$ ), carboxylates coordinated as unidentate. ${ }^{37}$ The carbonyl vibration $\mathrm{v}_{\mathrm{as}}(\mathrm{C}=\mathrm{O})$ of acetylacetonate splitted into two peaks and exhibited in the 1610 ~ $1535 \mathrm{~cm}^{-1}$ region.

X-ray crystal analyses also performed to establish the details of those coordination and to verify these geometric assignment.

## 4. FAB Mass Spectrometry

The FAB mass spectra of the complexes were shown in Fig. 21~ 29, and summarized at Table 14. The FAB mass spectra peaks of all complexes were corresponding to the molecular ion $\left[\operatorname{Cr}([14]-\text { decane })\left(\mathrm{L}_{\mathrm{a}}\right)_{m}\right]^{+}(m=1$ or 2$)$. The complexes of two coordinated auxiliary ligands generated two peaks to the species $\left[\operatorname{Cr}([14]-\text { decane })\left(\mathrm{L}_{\mathrm{a}}\right)\right]^{+}$and $\left[\mathrm{Cr}([14]-\text { decane })\left(\mathrm{L}_{\mathrm{a}}\right)_{2}\right]^{+}\left\{\mathrm{NCS}^{-}: m / z 394\right.$, $452 ; \mathrm{N}_{3}{ }^{-}: 377,420$; benzonate (bz) $: m / z 456,578$; $p$-chlorobenzonate (cbz) : m/z 490, 646 ; chloroacetate (ca) : $\mathrm{m} / \mathrm{z}$ 428, 522\}. The FAB mass spectrum of the oxalate complex $\left[\mathrm{Cr}([14]\right.$-decane)(ox) $] \mathrm{ClO}_{4} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}$ showed a peak at $\mathrm{m} / \mathrm{z} 424$ corresponding to the molecular ion $[\operatorname{Cr}([14]-\text { decane })(o x)]^{+}$. The molecular ion lost the exocyclic ligand (ox ; $\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}$ ) which revealed the formation of the fragment $[\operatorname{Cr}([14]-\text { decane })-\mathrm{H}]^{+}$at $\mathrm{m} / \mathrm{z} 335$. This fragment was well observed in the FAB mass spectra of all complexes. The mass spectrum of the malonate complex $[\mathrm{Cr}([14]$-decane $)(\mathrm{mal})] \mathrm{ClO}_{4} \cdot 0.25 \mathrm{H}_{2} \mathrm{O}$ showed a peak at $\mathrm{m} / \mathrm{z} 438$, which was corresponding to the molecular ion $[\mathrm{Cr}([14]-\text { decane })(\mathrm{mal})]^{+}$. In the mass spectrum of the acetylacetonate complex $[\mathrm{Cr}([14]$-decane $)$ - $(\mathrm{acac})]\left(\mathrm{ClO}_{4}\right) \cdot 0.5 \mathrm{H}_{2} \mathrm{O}$, peaks at $m / z 434$ and 534 were due to the species $\quad\left[\mathrm{Cr}([14] \text {-decane)(acac)-2H }]^{+}\right.$and $[\mathrm{Cr}([14]$-decane)(acac)
$\left.-\left(\mathrm{ClO}_{4}\right)-\mathrm{H}\right]^{+}$, respectively. In the FAB mass spectrum of $\left[\{\mathrm{Cr}([14] \text {-decane })(\mu-\text { cit })\}_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$, peak corresponding to bridged complex ion of the $\left[\{\mathrm{Cr}([14] \text {-decane })(\mu-\text { cit })\}_{2}\right]^{+}$type $([4])$ was observed at $\mathrm{m} / \mathrm{z} 1053$. Peaks at $\mathrm{m} / \mathrm{z} 526$ and 718 were due to the species $[\mathrm{Cr}([14] \text {-decane })(\text { cit })]^{+}$and $\left[\mathrm{Cr}([14] \text {-decane })(\text { cit }){ }_{2}\right]^{+}$, respectively.

## 5. Thermogravimetry

Thermogravimetry analysis(TGA) have been carried out simultaneously for the Cr (III) complexes of [14]-decane ligand (Fig. $30 \sim 38$ ). Thermogravimetric details were given in Table 15. It was found out from the results that the prepared macrocycle compounds have relatively high thermal stability. Bidentate oxalate and malonate ions were lost at $250 \sim 350^{\circ} \mathrm{C}$ range. Along with the removal of the those ion in the range of temperature, the perchlorate ion had also been removed. In acetylacetonate complex, two perchlorate ions were lost at $245 \approx 292^{\circ} \mathrm{C}$, and then coordinated acetylacetonate removed in the range of $292 \sim 349^{\circ} \mathrm{C}$. In $\mathrm{Cr}(\mathrm{III})$ complexes with monodentate ligands such as bezonate, $p$-chlorobenzonate, chloroacetate and azide were lost stepwise in $200 \sim 350^{\circ} \mathrm{C}$. And the perchlorate ion also removed at this temperature.

In $\left[\{\mathrm{Cr}([14] \text {-decane })(\mu-\text { cit })\}_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ complex, lattice water molecules were removed at near $210^{\circ} \mathrm{C}$. After two perchlorate and one coordinated citrate ion were lost at $210 \sim 283{ }^{\circ} \mathrm{C}$, and then one coordinated citrate ion removed at $283 \sim 357^{\circ} \mathrm{C}$. The macrocyclic entity changed slowly up to $350^{\circ} \mathrm{C}$, and then those complexes have been changed to green $\mathrm{Cr}_{2} \mathrm{O}_{3}$ were observed at over $990^{\circ} \mathrm{C}$.

## 6. Structure Analysis

1) Crystal Structure of cis-[Cr([14]-decane) $\left(\mathrm{NCS}_{2}\right] \mathrm{ClO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$

The structure of the cis- $\left[\mathrm{Cr}([14]-\right.$ decane $\left.)(\mathrm{NCS})_{2}\right] \mathrm{ClO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$ with the atomic labeling was depicted in Fig. 39. The figure was drawn by ORTEP program at $30 \%$ probability level. Table 16 and 17 showed the selected bond distances and bond angles.

The structure analysis indicated that the crystal consists of di(isothiocyanato)([14]-decane)chromium(III) mono-cation and perchlorate ion in the molecular ratio of $1: 1$, formulated as $\left[\mathrm{Cr}([14]\right.$-decane $\left.)(\mathrm{NCS})_{2}\right] \mathrm{ClO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$. This was well fitted with elemental analysis results. The hexacoordination geometry around $\mathrm{Cr}\left(\right.$ III ) ion exhibited a distorted octahedral structure $\left\{\mathrm{CrN}_{2} \mathrm{~N}^{\prime}{ }_{2}\right.$ ( $\mathrm{N}^{\prime}-\mathrm{NCS}$ )-plane and two N ( C -dimethyl) group of its z -axis\}. In this complex $\mathrm{Cr}($ III ) was coordinated with the four secondary nitrogen atoms of the macrocycle and two nitrogen atom of two isothiocyanate in the cis position. The $\mathrm{Cr}^{-\mathrm{N}^{\prime}(-N C S)}\{\mathrm{Cr}-\mathrm{N}(5)$; $1.964 \AA, \mathrm{Cr}-\mathrm{N}(6) ; 2.000 \AA\}$ bond distances were shorter than $\mathrm{Cr}-\mathrm{N}$ (macrocycle) bond distances $\{\mathrm{Cr}-\mathrm{N}(2) ; 2.103 \AA, \mathrm{Cr}-\mathrm{N}(4) ; 2.104 \AA$, $\left.\mathrm{Cr}-\mathrm{N}(3) ; 2.132 \AA \mathrm{~A}^{\mathrm{Cr}} \mathrm{Cr}-\mathrm{N}(4) ; 2.147 \AA \AA\right\}$. The $\mathrm{Cr}-\mathrm{N}(C-$ dimethyl) bond distances were slightly longer (average $0.036 \AA$ ) than the $\mathrm{Cr}-\mathrm{N}$
(C-methyl) bond distances. The $\mathrm{N}-\mathrm{C}-\mathrm{S}$ bond angles of coordinated $\mathrm{Cr}(\mathrm{III})$ were similar line: $\angle \mathrm{N}(5)-\mathrm{C}(17)-\mathrm{S}(1)=178.1(5)^{\circ}$, $\mathrm{N}(6)-\mathrm{C}(18)-\mathrm{S}(2)=177.3(6)^{\circ}$. The bond angles about the $\mathrm{Cr}-\mathrm{N}=\mathrm{CS}$ $\left\{\angle \mathrm{C}(17)-\mathrm{N}(5)-\mathrm{Cr}=165.0(4)^{\circ}, \quad \angle \mathrm{C}(18)-\mathrm{N}(6)-\mathrm{Cr}=167.3(5)^{\circ}\right\}$ deviated from $180^{\circ}$ caused by nonbonding electron pair of nitrogen atom. This revealed nitrogen atom was bonded to Cr ion.

2) Crystal Structure of $\mathbf{c i s}-\left[\mathrm{Cr}([14]-\right.$ decane $\left.)(\mathrm{cbz})_{2}\right] \mathrm{ClO}_{4}$

A perspective view of the structure of the cis $-[\operatorname{Cr}([14]-d e c a n e)$ - $\left.(\mathrm{cbz})_{2}\right]_{\mathrm{ClO}_{4}}$ with the atomic labeling was depicted in Fig. 40. The figure was drawn by ORTEP program at $30 \%$ probability level. Table 18 and 19 exihibited the selected bond distances and bond angles. The coordinated $p$-chlorobenzoate anions were bonded to chromium via one oxygen only. The structure analysis revealed the crystal consists of $\mathrm{di}(p$-chlorobenzoato)([14]-decane) chromium(III) mono-cation and perchlorate anion in a molecular ratio of $1: 1$, so formulated as $\left[\mathrm{Cr}([14]\right.$-decane $\left.)(\mathrm{cbz})_{2}\right] \mathrm{ClO}_{4}$. This was well fitted with elemental analysis results. The hexacoordination geometry around $\mathrm{Cr}($ III ) ion was a distorted octahedral $\left\{\mathrm{CrN}_{2} \mathrm{O}_{2}(\mathrm{O}-\mathrm{cbz})\right.$-plane and two N ( $C$-dimethyl) group of its $\mathrm{z}^{-a x i s\}}$ in which Cr (III) was coordinated with the four secondary nitrogen atoms of the macrocycle as well as with two oxygen atom of two chlorobezoate in the cis position. The average $\mathrm{Cr}-\mathrm{N}$ bond distance was $2.126(5) \AA$ and the average $\mathrm{Cr}-\mathrm{O}$ bond distance was 1.969 (4) $\AA$. The $\mathrm{Cr}-\mathrm{O}$ bond length was 1.969 A. It compared to distances of $1.952 \AA$ and $1.972 \AA$ found in $\left[\mathrm{Cr}(\mathrm{edma})_{2}\right]^{+}$moiety and $[\mathrm{Cr}(\mathrm{dpt})($ glygly $)] \mathrm{ClO}_{4}$, respectively. ${ }^{44,}{ }^{45}$ The compound has the $\mathrm{Cr}-\mathrm{N}$ bond lengths of the $\mathrm{CrN}_{4}$ moiety in the range $2.115 \sim 2.140$ $\AA$, and $\mathrm{O}-\mathrm{Cr}-\mathrm{O}$ angle was $89.2(2)^{\circ}$. The $\mathrm{Cr}-\mathrm{N}$ bond distances of
this complex (average $2.126 \AA$ ) were slightly longer than those of trans $-\left[\mathrm{Cr}\left(\mathrm{Me}_{2} \mathrm{tn}\right)_{2} \mathrm{Br}_{2}\right]^{+}$moiety (from 2.078 to 2.089 A). ${ }^{46}$ The complex has a cis configuration with respected to the carboxylate oxygen. The average bond angles of five- and six-membered chelate rings around chromium(III) are known as 83.1 and $87.5^{\circ}$, respectively. The $\mathrm{Cr}-\mathrm{N}$ ( $C$-dimethyl) bond distances $\{\mathrm{Cr}-\mathrm{N}(2)$; $2.140(5) \AA, \quad \mathrm{Cr}-\mathrm{N}(4) ; 2,131(5) \AA\}$ were slightly longer (average 0.020 A) than the $\mathrm{Cr}-\mathrm{N}(C$-methyl $)$ bond distances $\{\mathrm{Cr}-\mathrm{N}(1)$; $2.115(5) \AA, \mathrm{Cr}-\mathrm{N}(3) ; 2,118(5) \AA\}$. The bond angles with the metal ion exhibited distorted octahedral angles: $\mathrm{O}(1)-\mathrm{Cr}-\mathrm{O}(3)$, $\mathrm{O}(1)-\mathrm{Cr}-\mathrm{N}(1), \quad \mathrm{O}(3)-\mathrm{Cr}-\mathrm{N}(3), \quad \mathrm{N}(1)-\mathrm{Cr}-\mathrm{N}(3), \quad \mathrm{O}(3)-\mathrm{Cr}-\mathrm{N}(1)$, $\mathrm{O}(1)-\mathrm{Cr}-\mathrm{N}(3)$ and $\mathrm{N}(4)-\mathrm{Cr}-\mathrm{N}(2)$ angles were $89.2(2)^{\circ}$, $87.7(2)^{\circ}$, $84.8(2)^{\circ}, 98.4(2)^{\circ}, 176.5(2)^{\circ}, 173.9(2)^{\circ}$ and $165.5(2)^{\circ}$ respectively.

Intramolecular hydrogen bonding interactions were found between
the uncoordinated carboxylate oxygen atoms of $p$-chlorobenzoic acid and the hydrogen atom of secondary amines in the macrocycle formed stable six-membered rings $\{\mathrm{O}(2) \cdots \mathrm{N}(4)=2.721(7) \AA, \angle$ $\mathrm{O}(2)-\mathrm{H}(4)-\mathrm{N}(4) \quad 153.5^{\circ} ; \mathrm{O}(4) \cdots \mathrm{N}(2)=2.791(7) \AA, \quad \angle \mathrm{O}(4)-\mathrm{H}(2)-\mathrm{N}(2)$ $\left.145.6^{\circ}\right\}$.

3) Crystal Structure of cis- $[\mathrm{Cr}([14]-$ decane $)(\mathrm{acac})]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}$

A perspective view of the structure of the cis $-[\operatorname{Cr}([14]$ -decane) $(\mathrm{acac})]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}$ with the atomic labeling was depicted in Fig. 41. The figure was drawn by ORTEP program at $30 \%$ probability level. Table 20 and 21 revealed the selected bond distances and bond angles. The hexacoordination geometry around $\mathrm{Cr}\left(\right.$ III ) ion was a distorted octahedral $\left\{\mathrm{CrN}_{2} \mathrm{O}_{2}(\mathrm{O}\right.$-acac)-plane and two $\mathrm{N}(C$-dimethyl $)$ group of its $\left.z^{-a x i s}\right\}$ in which $\mathrm{Cr}(\mathrm{IIII})$ was coordinated with the four secondary nitrogen atoms of the macrocycle as well as with two oxygen atom of bidentated acethylacetone(acac) in the cis position. The average distance of $\mathrm{Cr}-\mathrm{N}$ and $\mathrm{Cr}-\mathrm{O}$ bond were $2.121(2) \AA$ and 1.953(2) $\AA$, respectively. The bond distances of $\mathrm{Cr}-\mathrm{N}(1)(2.130(3) \AA$ ) and $\mathrm{Cr}-\mathrm{N}(3)$ (2.133(3) $\AA$ ) were slightly longer (average $0.023 \AA$ ) than those of $\mathrm{Cr}-\mathrm{N}(2)$ (2.112(3) $\AA$ ) and $\mathrm{Cr}-\mathrm{N}(4)(2.107(3) \AA$ ). The bond angles with the metal ion exhibited distorted octahedral angles : $\angle \mathrm{N}(4)-\mathrm{Cr}-\mathrm{N}(2), \angle$ $\mathrm{O}(1)-\mathrm{Cr}-\mathrm{N}(4), \quad \angle \mathrm{N}(1)-\mathrm{Cr}-\mathrm{N}(3), \quad$ and $\angle \mathrm{O}(2)-\mathrm{Cr}-\mathrm{N}(4)$ angles were $98.69(12)^{\circ}, 85.34(11)^{\circ}, 169.49(12)^{\circ}$, and $172.94(12)^{\circ}$, respectively.

The $\mathrm{C}(18)-\mathrm{O}(2)$ and $\mathrm{C}(20)-\mathrm{O}(1)$ bond distances were $1.283(5) \AA$ and $1.280(5) \AA$, respectively. Those distances were distinctly longer than general $\mathrm{C}=\mathrm{O}$ double bond distance (1.203 $\AA$ ), and shorter than $\mathrm{C}-\mathrm{O}$ single bond distance(1.317 $\AA$ ). The $\mathrm{O}(2)-\mathrm{Cr}-\mathrm{O}(1)$ angle was $89.85(11)$.

The water molecule formed hydrogen bonds with each other \{O1 $\mathrm{W} \cdots \mathrm{O} 1 \mathrm{~W}=2.645(45) \AA$.

Fig. 41. ORTEP plot of the cis $-[\mathrm{Cr}([14]$-decane $)(\mathrm{acac})]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 0.5$ $\mathrm{H}_{2} \mathrm{O}$ complex.

4) Crystal Structure of cis-[\{Cr([14]-decane) $(\mu-$ cit $\left.)\}_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$

The structure of the cis-[\{Cr([14]-decane) $(\mu-$ cit $\left.)\}_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ with the atomic labeling was depicted in Fig. 42. The figure was drawn by ORTEP program at $30 \%$ probability level. Table 22 and 23 showed the selected bond distances and bond angles. The structure of the cation in this complex revealed two identical homobinuclear $\mathrm{Cr}(\mathrm{III}) \mathrm{Cr}$ (III) cores joined by two bridging $\operatorname{cit}\left(-\mathrm{OOCCH}_{2} \mathrm{C}-(\mathrm{OH})\left(\mathrm{CH}_{2} \mathrm{COOH}\right) \mathrm{COO}-\right)$ group linkage. The cation was centro-symmetric. The structure analysis indicated that the crystal consists of $\operatorname{di}(\mu-c i t)\{([14]-\text { decane }) \text { chromium }(\text { III })\}_{2}$ cation $([4])$ and perchlorate in a molecular ratio of $1: 2$, so that it can be formulated as cis $-\left[\{\mathrm{Cr}([14] \text {-decane })(\mu-\mathrm{cit})\}_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$. This was well fitted with elemental analysis and molar conductivity (168.6 ohm ${ }^{-1} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}$ ). The hexacoordination geometry around $\mathrm{Cr}(\mathrm{III})$ ion was a distorted octahedral $\left\{\mathrm{CrN}_{2} \mathrm{O}_{2}(\mathrm{O}\right.$-cit $)$-plane and two macrocyclic N (C-dimethyl) group of its $z$-axis\} in which $\mathrm{Cr}(\mathrm{III})$ was coordinated with the four secondary nitrogen atoms of the macrocycle as well as with two oxygen atom of two monodentated citrate in the cis position. The average $\mathrm{Cr}-\mathrm{N}$ bond distance was $2.121(9) \AA$ and the average $\mathrm{Cr}-\mathrm{O}$ bond distance was 1.958 (8) $\AA$. These values were similar to acetylactonate and $p$-chlorobenzonate Cr (III) complexes of [14]-decane. The $\mathrm{Cr}-\mathrm{N}$ ( C -dimethyl) bond
distances $\{\mathrm{Cr}-\mathrm{N}(2) ; 2.147(9) \AA, \mathrm{Cr}-\mathrm{N}(4) ; 2,117(9) \AA$ § were slightly longer (average $0.022 \AA$ ) than the $\mathrm{Cr}-\mathrm{N}$ ( $C$-methyl) bond distances $\{\mathrm{Cr}-\mathrm{N}(1) ; 2.108(9) \AA, \mathrm{Cr}-\mathrm{N}(3) ; 2,111(9) \AA\}$. The bond angles with the metal ion revealed distorted octahedral structure: $\mathrm{O}(1)-\mathrm{Cr}-\mathrm{N}(1)$ and $\mathrm{O}(3)-\mathrm{Cr}-\mathrm{N}(3)$ angles are $86.8(3)^{\circ}$ and $84.8(4)^{\circ}$, respectively.

The distence between two Cr metal ions was $7.360 \AA$. In this complex also had intramolecular hydrogen bond, similar with p-chlorobenzoic acid case. Interactions between the uncoordinated carboxylate oxygen atoms of citrate and the hydrogen atom of secondary amines in macrocycle formed stable six-membered rings.

Fig. 42. ORTEP plot of the cis $-\left[\{\mathrm{Cr}([14]-\text { decane })(\mu-\mathrm{cit})\}_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$. $6 \mathrm{H}_{2} \mathrm{O}$ complex.

## IV. Conclusions

The reaction of $\mathbf{c i s}-\left[\mathrm{Cr}([14]-\text { decane })\left(\mathrm{OH}_{2}\right)_{2}\right]^{+} \quad([14]$-decane $=$ rac-5,5, 7, 12, 12, 14-hexamethyl-1, 4, 8, 11-teraazacyclotetradecane) with $\mathrm{O}-\left\{\mathrm{L}_{\mathrm{a}}\right.$ : chloroacetate (ca), benzoate (bz), p-chlorobenzoate (cbz), oxalate (ox), malonate (mal), acetylacetonate (acac), citrate (cit)\}, or $\mathrm{N}^{-}\left\{\mathrm{L}_{\mathrm{a}}: \mathrm{NCS}^{-}, \mathrm{N}_{3}{ }^{-}\right\}$bonded auxiliary ligands formed a new cis-[Cr(III)([14]-decane) $\left.\left(\mathrm{L}_{\mathrm{a}}\right)_{m}\right]^{n+}$ complexes. The complexes have shown a distorted octahedral coordination environment with the macrocycle adopting a folded cis-V conformation.

The structure analysis indicated that the crystal consists of di(isothiocyanato)([14]-decane)chromium(III) mono-cation and perchlorate ion in the molecular ratio of $1: 1$, formulated as $\left[\mathrm{Cr}([14]\right.$-decane $\left.)(\mathrm{NCS})_{2}\right] \mathrm{ClO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$. This was well fitted with elemental analysis results. The hexacoordination geometry around Cr (III) ion exhibited a distorted octahedral structure $\left\{\mathrm{CrN}_{2} \mathrm{~N}^{\prime}{ }_{2}\right.$ ( $\mathrm{N}^{\prime}-N C S$ )-plane and two N ( $C$-dimethyl) group of its z -axis $\}$. In this complex $\mathrm{Cr}($ III ) was coordinated with the four secondary nitrogen atoms of the macrocycle and two nitrogen atom of two isothiocyanate in the cis position.

The structure analysis revealed the crystal consists of di( $p$-chlorobenzoato)([14]-decane) chromium(III) mono-cation and
perchlorate anion in a molecular ratio of $1: 1$, so formulated as $\left[\mathrm{Cr}([14]\right.$-decane $\left.)(\mathrm{cbz})_{2}\right] \mathrm{ClO}_{4}$. This was well fitted with elemental analysis results. The hexacoordination geometry around $\mathrm{Cr}(\mathrm{III})$ ion was a distorted octahedral $\left\{\mathrm{CrN}_{2} \mathrm{O}_{2}(\mathrm{O}-\mathrm{cbz})\right.$-plane and two N ( $C$-dimethyl) group of its $z^{-a x i s}$ ) in which $\mathrm{Cr}($ III $)$ was coordinated with the four secondary nitrogen atoms of the macrocycle as well as with two oxygen atom of two chlorobezoate in the cis position. Intramolecular hydrogen bonding interactions were found between the uncoordinated carboxylate oxygen atoms of $p$-chlorobenzoic acid and the hydrogen atom of secondary amines in the macrocycle formed stable six-membered rings.

In the structure of $\overline{c i s}-[\mathrm{Cr}([14]$-decane $)(\mathrm{acac})]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}$, the hexacoordination geometry around Cr (III) ion was a distorted octahedral $\left\{\mathrm{CrN}_{2} \mathrm{O}_{2}(\mathrm{O}\right.$-acac)-plane and two $\mathrm{N}(C$-dimethyl) group of its z-axis\} in which Cr (III) was coordinated with the four secondary nitrogen atoms of the macrocycle as well as with two oxygen atom of bidentated acethylacetone(acac) in the cis position.

The structure of the cation in citrato complex revealed two identical homobinuclear Cr (III) Cr (III) cores joined by two bridging citrato group linkage. The cation was centro-symmetric. The structure analysis indicated that the crystal consists of $\mathrm{di}(\mu$ -cit) $\{([14]-\text { decane }) \text { chromium(III) }\}_{2}$ cation([4]) and perchlorate in a molecular ratio of $1: 2$, so that it can be formulated as
cis- $\left[\{\mathrm{Cr}([14]-\text { decane })(\mu-\mathrm{cit})\}_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$. This was well fitted with elemental analysis and molar conductivity. The hexacoordination geometry around Cr (III) ion was a distorted octahedral $\left\{\mathrm{CrN}_{2} \mathrm{O}_{2}(\right.$ O-cit $)$-plane and two macrocyclic N ( $C$-dimethyl) group of its $z$-axis in which $\mathrm{Cr}($ III ) was coordinated with the four secondary nitrogen atoms of the macrocycle as well as with two oxygen atom of two monodentated citrate in the cis position. The distence between two Cr metal ions was $7.360 \AA$. In this complex also had intramolecular hydrogen bond, similar with p-chlorobenzoic acid case. Interactions between the uncoordinated carboxylate oxygen atoms of citrate and the hydrogen atom of secondary amines in macrocycle formed stable six-membered rings.

The visible absorption spectra of $\operatorname{cis}-\operatorname{Cr}([14]-$ decane $\left.)\left(\mathrm{L}_{\mathrm{a}}\right)_{m}\right]^{n^{+}}$in DMF solution at room temperature exhibited two bands, at 17400 ~ $18800 \mathrm{~cm}^{-1}\left(\mathrm{v}_{1}\right)$ and $23400 \sim 25900 \mathrm{~cm}^{-1}\left(\mathrm{v}_{2}\right)$, due to the ${ }^{4} A_{2 \mathrm{~g}} \rightarrow{ }^{4} T_{2 \mathrm{~g}}$ and ${ }^{4} A_{2 \mathrm{~g}} \rightarrow{ }^{4} T_{1 \mathrm{~g}}\left(O_{\mathrm{h}}\right)$ transitions, respectively. In these complexes, the nearly symmetric profiles of two quartet bands and the higher extinction coefficient of $134 \sim 223 \mathrm{M}^{-1} \mathrm{~cm}^{-1}$ were evidences of the cis configuration. A chromium complexes in tetragonal symmetry are expected to have four absorption bands in $d-d$ region, but each spectrum apparently has two major components. For the splitting of the two bands, we have fitted the band profiles to four or five Gaussian curves. The contribution from outside bands was
corrected for fine deconvolution. The four peak positions can be assigned to the ${ }^{4} E\left({ }^{4} T_{2 \mathrm{~g}}\right.$ in $O_{h}$ symmetry), ${ }^{4} B_{2}\left({ }^{4} T_{2 \mathrm{~g}}\right),{ }^{4} E\left({ }^{4} T_{1 \mathrm{~g}}\right)$ and ${ }^{4} A_{2}\left({ }^{4} T_{1 \mathrm{~g}}\right)$, respectively.

In mid-infrared spectra of the nine complexes, the broadness of absorption bands near $3400 \mathrm{~cm}^{-1}$ indicated that there were hydrogen bonds in these complexes. Two strong bands in the region of $3300 \sim 3050 \mathrm{~cm}^{-1}$ were due to the symmetric and antisymmetric $\mathrm{N}-\mathrm{H}$ stretching modes. Two strong bands in the region of $2990 \sim 2860 \mathrm{~cm}^{-1}$ were due to the symmetric and antisymmetric $\mathrm{C}-\mathrm{H}$ stretching modes. The very strong absorption at near $1100 \mathrm{~cm}^{-1}$ and near $620 \mathrm{~cm}^{-1}$ were assigned to ionic perchlorate. Two peaks at near 440 and near $480 \mathrm{~cm}^{-1}$ were assigned to the $\mathrm{Cr}-\mathrm{N}$ stretching mode. The present complexes exhibited three $\mathrm{N}-\mathrm{H}$ wagging bands at near 890, near 860 and near $840 \mathrm{~cm}^{-1}$ region. Two $\mathrm{CH}_{2}$ rocking bands were exhibited at near 820 and near $780 \mathrm{~cm}^{-1}$. Since the infrared spectra of the title complexes were consistent with the cis configuration. The IR spectra of the cis $-\left[\mathrm{Cr}([14]-\right.$ decane $\left.)(\mathrm{NCS})_{2}\right] \mathrm{ClO}_{4}$ complex revealed that the ambidentate thiocyanate ligand was N -bonded. Two stretching frequencies $\mathrm{v}_{\mathrm{as}}\left(\mathrm{COO}^{-}\right)$and $\mathrm{v}_{\mathrm{s}}\left(\mathrm{COO}^{-}\right)$found at near 1600 and near $1350 \mathrm{~cm}^{-1}$ revealed that the carboxylate oxygen was coordinated. Unidentate carboxylate complexes have much greater $\Delta$ v [between $\mathrm{v}_{\mathrm{as}}\left(\mathrm{COO}^{-}\right)$and $\mathrm{v}_{\mathrm{s}}\left(\mathrm{COO}^{-}\right)$] values than the ionic
compounds. Since there were large $\Delta v$ values (oxalate: $296 \mathrm{~cm}^{-1}$, malonate: $296 \mathrm{~cm}^{-1}$, bezonate: $242 \mathrm{~cm}^{-1}$, p-chlorobezonate: 257 $\mathrm{cm}^{-1}$, chloroacetate : $338 \mathrm{~cm}^{-1}$, citratate: $230 \mathrm{~cm}^{-1}$ ), carboxylates coordinated as unidentate.

The FAB mass spectra peaks of all complexes were corresponding to the molecular ion $\left[\operatorname{Cr}([14]-\text { decane })\left(\mathrm{L}_{\mathrm{a}}\right)_{m}\right]^{+}(m=1$ or 2). The complexes of two coordinated auxiliary ligands generated two peaks to the species $\left[\operatorname{Cr}([14]-\text { decane })\left(\mathrm{L}_{\mathrm{a}}\right)\right]^{+}$and $\left[\mathrm{Cr}([14]-\text { decane })\left(\mathrm{L}_{\mathrm{a}}\right)_{2}\right]^{+}\left\{\mathrm{NCS}^{-}: m / z 394,452 ; \mathrm{N}_{3}{ }^{-}: 377,420\right.$; benzonate (bz) : m/z 456, 578 ; $p$-chlorobenzonate (cbz) : m/z 490, 646 ; chloroacetate (ca) : m/z 428, 522 \}.

Thermogravimetry analysis(TGA) for the Cr (III) complexes of [14]-decane ligand was found out from the results that the prepared macrocycle compounds have relatively high thermal stability. The macrocyclic entity changed slowly up to $350^{\circ} \mathrm{C}$, and then those complexes have been changed to green $\mathrm{Cr}_{2} \mathrm{O}_{3}$ were observed at over $990^{\circ} \mathrm{C}$.

## 국 문 초 록

cis $-\left[\mathrm{Cr}([14] \text {-decane })\left(\mathrm{OH}_{2}\right)_{2}\right]^{+} \quad([14]$-decane $=r a c-5,5,7,12,12$, 14-hexamethyl-1, 4, 8, 11-teraazacyclotetradecane)와 O -주게 리간드 $\left\{\mathrm{L}_{\mathrm{a}}:\right.$ chloroacetate, benzoate, $p$-chlorobenzoate, oxalate, malonate, acetylacetonate, citrate $\}$ 또는 N -주게 보조 리간드 $\left\{\mathrm{L}_{\mathrm{a}}: \mathrm{NCS}^{-}, \mathrm{N}_{3}{ }^{-}\right\}$의 반응으로부터 새로운 cis-[Cr(III)([14]-decane) $\left.\left(\mathrm{L}_{\mathrm{a}}\right)_{m}\right]^{n+}$ 착물을 합성하였 다. 이들 착물들은 원소분석, 전기전도도, UV-Vis, IR 분광법, 질량 분석 법, 열중량 분석법 및 X-ray 결정분석법 등을 이용하여 특성 및 구조적 성질을 확인•고찰하였다. 이들 착물들은 보조 리간드가 cis-V형으로 결 합된 찌그러진 팔면체 구조를 이루고 있음을 확인하였다. isothiocyanate 및 $p$-chlorobenzonate 착물들은 2 개의 보조 리간드가 $\mathrm{Cr}^{3+}$ 중심금속에 monodentate로 배위된 cis-[Cr([14]-decane)(NCS) 2$] \mathrm{ClO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$ 과 cis-$\left[\mathrm{Cr}([14]-\right.$ decane $\left.)(\mathrm{cbz})_{2}\right] \mathrm{ClO}_{4}$ 착물을 형성하였다. acetylacetonate 착물은 1 개의 보조 리간드가 $\mathrm{Cr}^{3+}$ 중심금속에 bidentate로 배위된 $\operatorname{cis}-[\mathrm{Cr}([14]$ -decane) $(\mathrm{acac})]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}$ 착물을 형성하였다. 또한, citrate 착물은 2 개 의 citrate가 2 개의 $\mathrm{Cr}^{3+}$ 에 다리로 배위된 $\quad \operatorname{cis}-[\{\mathrm{Cr}([14]$-decane $)(\mu$ $-\mathrm{cit})\}_{2}\left(\mathrm{ClO}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ 착물을 형성하였고, 두 금속간의 거리는 $7.360 \AA$ 이었 다. DMF 용액에서 Cr 착물들의 전자흡수 스펙트럼 결과, ${ }^{4} A_{2 \mathrm{~g}} \rightarrow{ }^{4} T_{2 \mathrm{~g}}$ 와 ${ }^{4} A_{2 \mathrm{~g}} \rightarrow{ }^{4} T_{1 \mathrm{~g}}\left(O_{\mathrm{h}}\right)$ 전이에 해당하는 $17400 \sim 18800 \mathrm{~cm}^{-1}\left(\mathrm{v}_{\mathrm{r}}\right)$ 와 2340 $0 \sim 25900 \mathrm{~cm}^{-1}\left(\mathrm{v}_{2}\right)$ 에 흡수띠가 나타났다. Cr 착물들의 FAB 질량 분석에 서 $\left[\operatorname{Cr}([14]-\text { decane })\left(\mathrm{L}_{\mathrm{a}}\right)_{m}\right]^{+}$착이온 종에 해당하는 피이크들을 확인할 수

있었다. 열중량 분석 결과 착물들은 비교적 열적으로 안정하였으며, $350^{\circ} \mathrm{C}$ 이상에서 거대고리 리간드가 서서히 분해가 일어나 최종적으로 $990^{\circ} \mathrm{C}$ 이 상에서는 녹색의 $\mathrm{Cr}_{2} \mathrm{O}_{3}$ 로 변해감을 확인하였다.

## 감 사 의 글

짧지 않은 시간이었습니다.
여러모로 부족한 저를 지금까지 이끌어 주신 변종철 교수님을 비롯하여 늘 격려해 주시고 용기를 북돋워 주신 제주대학교 화학과 교수님들 한분 한분 께 깊이 감사드립니다. 또한, 먼 길을 마다 않으시고 제주까지 와 주셔서 깨우침과 자상한 지도를 해주신 박유철 교수님과 김양 교수님께 다시 한번 머리 숙여 감사드립니다. 이것이 끝이 아니고 단지 새로운 시작을 위한 작 은 매듭임을 깨닫게 해 주심 감사드립니다.
멋모르고 욕심만 내어 시작하였다가 중도에 어찌할 바 모르고 방황도 하였습니다. 그때마다 주위의 여러분들이 격려해 주신 덕분에 여기까지 올 수 있었습니다.

이 매듭을 짓는데 있어서 가장 큰 도움을 준 한충훈 학우, 문대훈 선생 님, 이우환 선생님과 제주대 무기화학연구실 후배 모두에게 각별한 감사를 드리며, 모두 건승하시길 바랍니다.

묵묵히 옆에서 늘 믿어주고 도와준 아내와 두 아들 원영, 원재 세상 누 구보다 사랑합니다. 평생을 고생하시는 부모님께 늘 마음이 무거웠습니다. 이 일이 부모님께 작은 기쁨이라도 되기를 바랍니다.

지금껏 살아오는 동안 여러 장소 여러 가지에 걸친 수많은 인연들을 소 중하게 생각합니다. 일일이 열거하지 못한 모든 인연들이 모두 합하여 큰 선을 이루게 되기 바랍니다.

끝으로 제주대로의 첫 발을 내 딛던 날 먼 나라로 가신 장인어른과 제가 나서 철 들 때까지 오로지 한마음으로 보살펴 주신 할머님이 그립습니다.
