## Contents

List of Tables ..... iv
List of Figures ..... ix
Abstract ..... xvii
I. Introduction ..... 1
II. Experimental section ..... 6

1. Chemicals and Physical Measurements ..... 6
2. Synthesis of Ligand and Complexes ..... 7
1) Preparation of 2 , 6-diformyl-p-cresol ..... 7
2) Preparation of $\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right) \cdot 2 \mathrm{HClO}_{4}$ ..... 7
3) Preparation of binuclear $\mathrm{Cu}(\mathrm{II})$ complexes ..... 8
4) Preparation of bi- and mono-nuclear $\mathrm{Ni}(\mathrm{II})$ complexes ..... 15
5) Preparation of binuclear $\mathrm{Mn}(\mathrm{II})$ complex ..... 26
6) Preparation of mononuclear lanthanide complexes ..... 27
3. X-ray Diffraction Measurements ..... 31
1) $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ ..... 31
2) $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$ ..... 36
3) $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ ..... 41
4) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ ..... 46
5) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ ..... 53
6) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$ ..... 58
7) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right]$ ..... 64
8) $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]\right.\right.$ - HMTADO$\left.)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ ..... 70
III. Results and Discussion ..... 77
1. Synthesis and characterization of the hexamethyl tetraazadioxa macrocyclic ligand $\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO} \cdot 2 \mathrm{HClO}_{4}\right)$ ..... 77
2. IR spectra of the complexes ..... 85
1) $\mathrm{Cu}(\mathrm{II})$ complexes ..... 85
2) $\mathrm{Ni}(\mathrm{II})$ complexes ..... 89
3) $\mathrm{Mn}(\mathrm{II})$ complex ..... 91
4) lanthanide(III) complexes ..... 92
3. FAB-mass spectra of the complexes ..... 113
1) $\mathrm{Cu}(\mathrm{II})$ complexes ..... 113
2) bi- and mono-nuclear $\mathrm{Ni}(\mathrm{II})$ complexes ..... 114
3) Mn (II) complex ..... 115
4) lanthanide(III) complexes ..... 116
4. Electronic absorption spectrum ..... 148
1) $\mathrm{Cu}(\mathrm{II})$ complexes ..... 148
2) $\mathrm{Ni}(\mathrm{II})$ complexes ..... 149
3) $\mathrm{Mn}(\mathrm{II})$ and Ln (III) complexes ..... 150
5. Thermal stability ..... 166
1) $\mathrm{Cu}($ II $)$ complexes ..... 166
2) $\mathrm{Ni}(\mathrm{II})$ complexes ..... 166
3) lanthanide(III) complexes ..... 166
6. Crystal Structures of Complexes ..... 183
1) $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ ..... 183
2) $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$ ..... 192
3) $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ ..... 199
4) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ ..... 206
5) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ ..... 214
6) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$ ..... 221
7) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right]$ ..... 230
8) $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ ..... 236
IV. Conclusion ..... 242
References ..... 248

#### Abstract

The 22-membered phenol-based $\mathrm{N}_{4} \mathrm{O}_{2}$ compartmental macrocycle ligand $\mathrm{H}_{2}[22]$-HMTADO $\left\{5,5,11,17,17,23\right.$-hexamethyl-3,7,15,19-tetraazatricyclo[19,3,1, ${ }^{9,13}$ ] -hexacosa-1(25),2,7,9,11,13(26),14,19,21,23-decane-25,26-diol\} $\cdot 2 \mathrm{HClO}_{4}$ derived from the [2+2] cyclic condensation of 2,6-diformyl-p-cresol and 2,2-dimethyl $-1,3$-propanediamine with $\mathrm{HClO}_{4}$. The macrocycle ligand has relatively high thermal stability. Binuclear $\{\mathrm{Cu}(\mathrm{II}), \mathrm{Ni}(\mathrm{II})$, and $\mathrm{Mn}(\mathrm{II})\}$ and mononuclear $\{\mathrm{Ni}(\mathrm{II}), \operatorname{Pr}(\mathrm{III}), \mathrm{Sm}(\mathrm{III}), \mathrm{Gd}(\mathrm{III})$, and $\mathrm{Dy}(\mathrm{III})\}$ complexes with [2+2] symmetrical $\mathrm{N}_{4} \mathrm{O}_{2}$ compartmental macrocyclic ligand containing bridging phenolic oxygen atoms was synthesized by condensation of 2,6-diformyl-p-cresol and 2-dimethyl-1,3-propandiamine in the metal ions.․ㅡ서관

The reaction of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)\right] \mathrm{Cl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ with $\mathrm{L}_{\mathrm{a}}\left(\mathrm{ClO}_{4}{ }^{-}, \mathrm{CN}^{-}\right.$, NCS ${ }^{-}, \mathrm{N}_{3}{ }^{-}, \mathrm{NO}_{3}^{-}, \mathrm{NO}_{2}^{-}, \mathrm{Br}^{-}$, and $\mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-}$ ) ligands in aqueous solution formed a new $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})(\mathrm{CN})_{2}\right] \cdot$ $0.5 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})(\mathrm{NCS})\left(\mathrm{OH}_{2}\right)\right] \mathrm{NCS} \cdot 2 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right.$ $\left.-\left(\mathrm{N}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{N}_{3} \cdot \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO}) \mathrm{ONO}_{2}\right] \mathrm{NO}_{3} \cdot 4 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right.$ $\left.-\mathrm{NO}_{2}\right] \mathrm{NO}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right] \mathrm{Br}_{2} \cdot 1.5 \mathrm{H}_{2} \mathrm{O}$, and $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right.$ $\left.\mathrm{S}_{2} \mathrm{O}_{3}\right] \cdot 5 \mathrm{H}_{2} \mathrm{O}$ complexes.

The reaction of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{2}\right] \mathrm{Cl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ with $\mathrm{L}_{\mathrm{a}}\left(\mathrm{ClO}_{4}^{-}, \mathrm{CN}^{-}\right.$, $\mathrm{NCS}, \mathrm{N}_{3}^{-}, \mathrm{NO}_{3}^{-}, \mathrm{NO}_{2}^{-}, \mathrm{Br}^{-}$, and $\mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-}$ ) ligands in aqueous solution formed a new $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})(\mathrm{CN})_{2}\right] \cdot$ $0.5 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})(\mathrm{NCS})_{2}\left(\mathrm{OH}_{2}\right)\right] \cdot 2 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\right.$

$\left.-\left(\mathrm{OH}_{2}\right)\right], \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{ONO}_{2}\right)\left(\mathrm{OH}_{2}\right)_{2}\right] \mathrm{NO}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\right.$ $\left.-\mathrm{NO}_{2}\right] \mathrm{NO}_{2} \cdot \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\right] \mathrm{Br}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, and $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\right.$ $\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right]$ complexes. The mononuclear $\mathrm{Ni}(\mathrm{II})$ complex, $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\right.$ -( $\left.\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$, was synthesized by condensation of 2,6-diformyl-p-cresol and 2-dimethyl-1,3-propandiamine in nickel perchlorate hexahydrate. The reaction of $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ with $\mathrm{L}_{\mathrm{a}}\left(\mathrm{NCS}^{-}\right.$and $\left.\mathrm{N}_{3}{ }^{-}\right)$ ligands in aqueous solution formed a new $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)(\mathrm{NCS})_{2}\right] \cdot$ $\mathrm{H}_{2} \mathrm{O}$ and $\left.\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{N}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$ complexes.

The binonuclear $\mathrm{Mn}(\mathrm{II})$ complex, $\left[\mathrm{Mn}_{2}([22]-\mathrm{HMTADO}) \mathrm{Cl}_{2}\right] \cdot \mathrm{H}_{2} \mathrm{O}$, was synthesized by condensation of 2,6-diformyl-p-cresol and 2-dimethyl-1,3propandiamine in manganese acetate tetrahydrate.

The mononuclear lanthanide complexes, $\left[\operatorname{Pr}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right) \mathrm{O}_{2} \mathrm{NO}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot$ $2 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Sm}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right) \mathrm{O}_{2} \mathrm{NO}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Gd}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right) \mathrm{O}_{2} \mathrm{NO}\right]$ $\left(\mathrm{NO}_{3}\right)_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, and $\left[\mathrm{Dy}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right) \mathrm{O}_{2} \mathrm{NO}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}$, with [2+2] symmetrical $\mathrm{N}_{4} \mathrm{O}_{2}$ compartmental macrocyclic ligand containing bridging phenolic oxygen atoms was synthesized by condensation of 2,6-diformyl-p -cresol and 2-dimethyl-1,3-propandiamine in the lathanide ions.

These complexes have been characterized by a combination of elemental analysis, conductivity, IR and Vis spectroscopy, mass spectrometry, thermogravimetry, and X-ray crystallography. The crystal structures of eight complexes were determined by XRD ; (1) Octahedral-Octahedral environment $:\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$, $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 3 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$,
(2) Octahedral-Square pyramidal environment : $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$, (3)
trans-Square pyramidal-Square pyramidal environment : [Cuz([22]-HMTADO)( $\mathrm{OClO}_{3}$ ) $\left.\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$, (4) cis-Square pyramidal-Square pyramidal environment : [ $\left.\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(4-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right]$, (5) Octahedral environment : [ $\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)$ $\left.-\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$.

In the crystals of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$, the two azido groups coordinated to the nickel centers are situated trans to each other with respect to the mean $\left\{\mathrm{NiN}_{2} \mathrm{O}_{2}\right\}$ plane. The $\mathrm{N}_{3}$ ligand keep their linearity, $\mathrm{N}-\mathrm{N}-\mathrm{N}$ bond angle is $179.1(5)^{\circ}$, whereas the $\mathrm{Ni}(1)-\mathrm{N}(5)-\mathrm{N}(6)$ linkage is slightly bent $\left\{120.4(3)^{\circ}\right\}$ towards $\mathrm{Ni}(2)\{\mathrm{Ni}(2) \cdots \mathrm{N}(7) 3.619 \AA\}$. The $\mathrm{Ni}(1)-\mathrm{N}(5)-\mathrm{N}(6)$ basal least -trigonal plane are bent at basal least-trigonal plane for $\mathrm{N}(5)-\mathrm{Ni}(1)-\mathrm{Ni}(2)$ edge with a dihedral angle of $17.87^{\circ}$ towards $\mathrm{O}(2)$-phenolic group. The $\mathrm{Ni}(2)$ is displaced by $0.320 \AA$ from the basal $\mathrm{N}_{2} \mathrm{O}_{2}$ least-squares plane towards $\mathrm{N}(8)$ (azido). The $\mathrm{N}_{3}$ ligand keep their linearity, $\mathrm{N}-\mathrm{N}-\mathrm{N}$ bond angle is $177.8(4)^{\circ}$, whereas the $\mathrm{Ni}(2)-\mathrm{N}(8)-\mathrm{N}(9)$ linkage is slightly bent $\left\{121.3(3)^{\circ}\right\}$ towards the opposite $\mathrm{Ni}(1)$ by the repulsion of coordinated aqua of $\mathrm{Ni}(1)$. This complex is wholly asymmetric. The $\mathrm{O}(2)$-phenolic groups of macrocycle is bent $18.6^{\circ}$ with the basal $\mathrm{Ni}_{2} \mathrm{O}_{2}$ least-squares plane, whereas $\mathrm{O}(1)$-phenolic groups of macrocycle is flat with the basal $\mathrm{Ni}_{2} \mathrm{O}_{2}$ least-squares plane. Hydrogen bonds are between water and azide molecules of octahedral of neighbor complexes. And there are a weak $\pi-\pi$ interactions by aromatic ring of neighbor complexes ; a dihedral angle and a distance between aromatic rings are $9.4(2)^{\circ}$ and $4.1 \AA$, respectively.

In the crystals of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right]$, the geometry about two nickel metals in the $\mathrm{N}_{2} \mathrm{O}_{2}$ site are two square-pyramid with a sulfur atom and a oxygen atom of bridged thiosulfate in cis positions. The $\mathrm{Ni}(1)$ is
displaced by $0.430 \AA$ from the basal $\mathrm{N}_{2} \mathrm{O}_{2}$ least-squares plane towards $\mathrm{S}(2)$ (thiosulfate). The $\mathrm{Ni}(2)$ is displaced by $0.350 \AA$ from the basal $\mathrm{N}_{2} \mathrm{O}_{2}$ least-squares plane towards $\mathrm{O}(3)$ (thiosulfate). This complex is wholly asymmetric. The bridged thiosulfate, tetragonal geometry, slants toward the $\mathrm{Ni}(2)$ and the $\mathrm{O}(2)$-phenolic groups of macrocycle.

In the crystals of $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$, the geometry about $\mathrm{Ni}(1)$ in the $\mathrm{N}_{2} \mathrm{O}_{2}$ site is a octahedral with two oxygen atom of methanol molecule in trans positions, and other $\mathrm{N}_{2} \mathrm{O}_{2}$ site is vacant. The macrocyclic complex adopts a flat structure with the an octahedral nickel center bridged by the two phenoxide oxygen atoms. The two coordinated methanol molecules dihedral angle between the least-squares plan defined by $\mathrm{Ni}, \mathrm{O}(3)$, and $\mathrm{C}(29)$ and the plane defined by $\mathrm{Ni}, \mathrm{O}(4)$, and $\mathrm{C}(30)$ is $87.47^{\circ}$. This complex is wholly asymmetric. The $O(1)$-phenolic and $O(2)$-phenolic groups of macrocycle are bent $35.02^{\circ}$ and $28.46^{\circ}$ with the basal $\mathrm{NiN}_{2} \mathrm{O}_{2}$ least-squares plane, respectively.

These macrocyclic complexes have relatively high thermal stability.

## I. Introduction

Polyamines are essential for life. ${ }^{1}$ As a result, many studies have targeted polyamine as a potential site for chemotherapeutic intervention. ${ }^{2}$ Macrocyclic complexes with a tetraazamacrocyclic ligand (e. g., cyclen, cyclam, and bicyclam) and their derivatives have been found utilities in antitumor ${ }^{3-6}$ and anti-HIV ${ }^{7,8}$ applications.

Over the past decade, many studies have been focused upon metal complexes of cyclic triamines which cleaving carboxyester ${ }^{9}$, phos -phoeaster ${ }^{10-14}$, $\mathrm{RNA}^{15,16}$, $\mathrm{DNA}^{17,18}$, dipeptides and proteins ${ }^{19}$. To our knowledge, a few papers have been published for the cytotoxic properties and the in vivo antitumor effects of triazacyclic polyamines metal complexes ${ }^{20,21}$.

The application of designer compartmental ligands to the study of dinuclear metal complexes first occurred in the early 1970s and the term binucleating ligand was introduced by Robson ${ }^{22}$ for polydentate chelating ligands that are capable of simultaneously binding two metal ions in close proximity. If the metal ions used are of the same type then the term homodinuclear is used and if the two metal ions are different then the complex is termed heterodinuclear.

One interest in such bimetallic complexes lies in the area of magnetochemistry. Studies on the magnetic properties of homo- and hetero-dinuclear complexes have significantly helped in advancing our understanding of spin-exchange mechanisms, relating them to the geometries and to the ground state electronic configurations of the constituting metal
ions, and to the nature of the bridging group ${ }^{23}$. A second area of interest is bioinorganic chemistry where dinuclear complexes can serve as synthetic analogs for bimetallobiosites and so give insight into the significance of the bimetallic cores present therein ${ }^{24}$. This is very topical with the recent recognition of the heterodinuclear cores at the metallobiosites in purple acid phosphatase $(\mathrm{FeZn})^{25}$, human calcineurin $(\mathrm{FeZn})^{26}$ and human protein phos -phatase $1(\mathrm{MnFe})^{27}$ stimulating a search for model complexes of unsymmetrical ligands which can bind two dissimilar metal ions in close proximity ${ }^{28}$.

Various types of compartmental ligands including the end-off type, the side-off type and the macrocyclic type have been developed ${ }^{29-32}$. The macrocyclic Schiff bases (1), derived from the $[2+2]$ condensation of a 2,6-diacyl substituted phenol and a diamine, form a unique family of compartmental ligands. jeuu national university ligrary

The symmetrical macrocycle $\left(\mathrm{L}^{1}\right)^{2-}$ (2) was first obtained by Pilkington and Robson in 1970 as the dinuclear matal(II) complexes $\mathrm{M}_{2}\left(\mathrm{~L}^{1}\right) \mathrm{X}_{2}$, in a one pot reaction of 2,6-diformyl-p-cresol, 1,3-diaminopropane and a M (II) ion. ${ }^{22}$ The "direct template reaction" has been used for providing homodinuclear complexes of $\left(L^{1}\right)^{2-}$ and related symmetrical macrocycles. ${ }^{33 \sim 37}$ The $\mathrm{N}_{2} \mathrm{O}_{2}$ cavity of $\left(\mathrm{L}^{1}\right)^{2-}$, formed by a trimethylene lateral chain, has an appropriate size to accommodate a wide range of metal ions within its cavity. The analogous macrocycle $\left(\mathrm{L}^{2}\right)^{2-}$ (3), the smallest member in this family, can accommodate only the small $\mathrm{Cu}(\mathrm{II})$ and Ni (II) ions ${ }^{38 \sim 41}$ because the cavity derived from the ethylene lateral chain is small and the "salen" ( $N, N^{\prime}$-ethylenedisalicylaldiminate)-like entity embedded in the macrocyclic framework has little flexibility compared with salen itself. The synthesis of the metal-free, protonate form of $-\left(\mathrm{L}^{1}\right)^{2-}$ and $\left(\mathrm{L}^{2}\right)^{2-}$ (and their homologs) has been described by Schroder et al. ${ }^{42}$

$\left(L^{1}\right)^{2-}$
2

$\left(\mathrm{L}^{2}\right)^{2-}$
3

Many modifications can be made to the basic structure such as the provision of different lateral chains, the introduction of an additional donor atom on one lateral chain, and partial or full saturation at the azomethine linkages. For the macrocycles which have been reduced at the azomethine groups, a potentially donating auxiliary can be introduced at the aminic nitrogen as a pendant arm. Unsymmetrical modifications of the macrocycles are of importance for providing discrete heterodinuclear core complexes. The present review is concerned with hetero-dinuclear metal complexes derived from sym -metrical and unsymmetrical phenol-based compartmental ligands of this family.

Recent attention is directed to the organization of three or more metal centers in predetermined arrays using polynucleating macrocyclic ligands. For example, tetranuclear $\mathrm{Ni}(\mathrm{II})$ and $\mathrm{Zn}(\mathrm{H})^{43}$ and hexanuclear $\mathrm{Cu}(\mathrm{II})^{44}$ complexes have been obtained by the $[2+2]$ or $[3+3]$ condensation between 2,6-diformyl-p-cresol and 2,6-bis(aminomethyl)-4-methylphenol in the presence of the metal ions. Furthermore, the $[2+2]$ condensation product between 2,6-diformyl-p-cresol and 1,5-diamino-3-pentanol has been used to produce tetra-, octa-, and dodeca-nuclear $\mathrm{Cu}(\mathrm{II})$ complexes. ${ }^{43,} 45,46$

This work performs synthesis, crystal X-ray diffraction studies and physicochemical characterization of dinuclear $\{\mathrm{Cu}(\mathrm{II}), \mathrm{Ni}(\mathrm{II})$, and $\mathrm{Mn}(\mathrm{II})\}$ and mononuclear $\{\mathrm{Ni}(\mathrm{II}), \operatorname{Pr}(\mathrm{III}), \mathrm{Sm}(\mathrm{III}), \mathrm{Gd}(\mathrm{III})$, and $\mathrm{Dy}(\mathrm{III})\}$ complexes with [2+2] symmetrical $\mathrm{N}_{4} \mathrm{O}_{2}$ compartmental macrocyclic ligand $\left\{\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right.$; 5,5,11,17,17,23-hexamethyl-3,7,15,19-tetraazatricyclo[19,3, 1, $1^{9,13}$ ]hexacosa$1(25), 2,7,9,11,13(26), 14,19,21,23$-decane-25,26-diol\} containing bridging phenolic oxygen atoms synthesized by condensation, in the metal ions, of 2,6-
diformyl-p-cresol and 2-dimethyl-1,3-propandiamine.

## II. Experimental section

## 1. Chemicals and Physical Measurements

All chemicals were commercial analytical reagents and were used without further purification. For the spectroscopic and physical measurements, organic solvents were dried and purified according to the literature methods ${ }^{47}$. Nanopure quality water was used throughout this work. Microanalyses of C, H , and N were carried out using LECO CHN-900 analyzer. NMR spectra were obtained with a JNM-LA400 FT-NMR (JEOL) Spectrophotometer. Conductance measurements of the complexes were performed at $25 \pm 1^{\circ} \mathrm{C}$ using an ORION 162 conductivity temperature meter. IR spectra were recorded with a Bruker FSS66 FT-IR spectrometer in the range $4000-370 \mathrm{~cm}^{-1}$ using KBr pellets. Electronic absorption spectra were measured at $25^{\circ} \mathrm{C}$ on a UV-3150 UV-VIS-NIR Spectrophotometer (SHIMADZU). FAB-mass spectra were obtained on a JEOL JMS-700 Mass Spectrometer using argon ( $6 \mathrm{kV}, 10 \mathrm{~mA}$ ) as the FAB gas. The accelerating voltage was 10 kV andglycerol was used as the matrix. The mass spectrometer was operated in positive ion mode and mass spectrum was calibrated by Alkali-CsI positive. TGA was carried out on a TGA 2050 thermal analyzer. The thermogravimetric curves of complexes were recorded in $30 \sim 1000^{\circ} \mathrm{C}$ range under nitrogen atmosphere. The heating rate was $10^{\circ} \mathrm{C} / \mathrm{min}$.

## 2. Synthesis of Ligand and Complexes

## 1) Preparation of 2, 6-diformyl-p-cresol.

The synthesis of 2, 6-diformyl-p-cresol was prepared according to the methods previously reported. ${ }^{48,49}$

## 2) Preparation of ( $\left.\mathbf{H}_{2}[22]-\mathrm{HMTADO}\right) \cdot \mathbf{2 H C l O}_{4}$;

$\left\{5,5,11,17,17,23\right.$-hexamethyl-3,7,15,19-tetraazatricyclo[19, 3, 1, $\left.1^{9,13}\right]$ hexacosa -1(25),2,7,9,11,13(26),14,19,21,23-decane-25,26-diol $\left.\cdot 2 \mathrm{HClO}_{4}\right\}$ ligand.

To a solution of 2,2-dimethyl-1,3-propanediamine $(0.206 \mathrm{~g})$ in 20 mL of ethanol was added 0.17 mL of $70 \% \mathrm{HClO}_{4}$. The mixture was added a solution of 2,6-diformyl-p-cresol $(0.328 \mathrm{~g})$ in 20 mL of ethanol and the resulting red solution was refluxed for 1 h , after which time a yellow-red compound separated out. The solution was cooled to room temperature and the yellow-red product was filtered, thoroughly washed with ethanol, dried under vacuum over anhydrous calcium chloride.

Yield 0.550 g (83\%).

$v(\mathrm{C}=\mathrm{C}$, aromatic $) ; 1088,624 v\left(\mathrm{ClO}_{4}^{-}\right)$.

## 3) Preparation of binuclear Cu (II) complexes.

The dinuclear $\mathrm{Cu}(\mathrm{II})$ complexes with [2+2] symmetrical $\mathrm{N}_{4} \mathrm{O}_{2}$ compartmental macrocyclic ligand $\left\{([22]-\mathrm{HMTADO})^{2-}\right\}$ containing bridging phenolic oxygen atoms was synthesized by condensation, in the $\mathrm{Cu}(\mathrm{II})$ ions, of 2,6-diformyl- $p$-cresol and 2-dimethyl-1,3-propandiamine (Scheme 1).

## (1) $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)\right] \mathrm{Cl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$.

A solution of 2,6-diformyl-p-cresol (1.312 g) in the boiling methanol (30 mL ) was added to the pale blue suspension formed by mixing 2 , 2-dimethyl-1,3-propandiamine $(0.824 \mathrm{~g})$ with a solution of cupric chloride dihydrate $(1.364 \mathrm{~g})$ in methanol ( 30 mL ). The mixture was heated under reflux whereupon the initial yellow suspended solid first turned dark green and then eventually dissolved. Methanol was removed by boiling at atmospheric pressure until precipitation had just commenced and the dark green mixture was poured into ten times its volume of tetrahydrofuran. The resulting pale green precipitate was filtered, thoroughly washed twice with

Scheme 1. Synthesis of the binuclear $\mathrm{Cu}(\mathrm{II})$ complexes of phenol-based macrocyclic ligand ([22]-HMTADO).
tetrahydrofuran, and dried in vacuo. Then recrystallized from hot water, yielding crystal as dark green platelets which were dried over anhydrouse calcium chloride at room temperature and atmospheric pressure. Prolonged heating in vacuum at $150^{\circ} \mathrm{C}$ was required for removal of the water.

Recrystallization from water formed $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ as good crystals suitable for X-ray crystallography.

Yield $2.550 \mathrm{~g}(92 \%)$.
Anal. Calc. (\%) for $\mathrm{Cu}_{2}\left(\mathrm{C}_{28} \mathrm{H}_{34} \mathrm{~N}_{4} \mathrm{O}_{2}\right)(\mathrm{Cl})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}$ : C, 48.56 ; H, 5.53 ; N, 8.09.

## 제주대학교 중앙도서과

Nickel perchlorate hexahydrate ( 2.194 g ), 2,6-diformyl-p-cresol (0.657 g), and 2-dimethyl-1,3-propandiamine $(0.412 \mathrm{~g})$ were heated under reflux in methanol ( 100 mL ) for 4 h . The resulting solution was evaporated to approx. 30 mL and on standing overnight at room temperature. The yellow-red product was filtered, thoroughly washed with ice-cold methanol, dried under vacuum over anhydrouse calcium chloride.

Recrystallization from acetonitrile formed $\left.\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right)\right]\left(\mathrm{ClO}_{4}\right)_{2}$ as good crystals suitable for X-ray crystallography.

Yield $0.554 \mathrm{~g}(35 \%)$.
Anal. Calc. (\%) for $\mathrm{Ni}\left(\mathrm{C}_{28} \mathrm{H}_{36} \mathrm{~N}_{4} \mathrm{O}_{2}\right)\left(\mathrm{ClO}_{4}\right)_{2}\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{2}$ :

Scheme 4. Synthesis of the binuclear $\mathrm{Mn}(\mathrm{II})$ complex of phenol-based macrocyclic ligand ([22]-HMTADO).

## 5) Preparation of binuclear $\mathrm{Mn}(\mathrm{II})$ complex.

The dinuclear $\mathrm{Mn}(\mathrm{II})$ complexes with [2+2] symmetrical $\mathrm{N}_{4} \mathrm{O}_{2}$ compartmental macrocyclic ligand $\left\{([22]-\mathrm{HMTADO})^{2-}\right\}$ containing bridging phenolic oxygen atoms was synthesized by condensation, in the Mn (II) ions, of 2,6-diformyl-p-cresol and 2-dimethyl-1,3-propandiamine (Scheme 4).

## (1) $\left[\mathbf{M n}_{2}([22]-H M T A D O) \mathrm{Cl}_{2}\right] \cdot \mathbf{H}_{2} \mathrm{O}$.

A solution of 2,6-diformyl-p-cresol ( 0.328 g ) in the boiling methanol (30 mL ) was added to the pale brown solution formed by mixing 2 , 2-dimethyl-1,3-propandiamine $(0.206 \mathrm{~g})$ with a solution of manganese acetate tetrahydrate $(0.619 \mathrm{~g})$ in methanol $(80 \mathrm{~mL})$. The mixture was heated under reflux for 30 min , and then was dropwise added a saturated aqueous sodium chloride ( 1 mL ). The resulting dark green mixture was stirred at the reflux temperature for 1 h to give an orange microcrystalline powder. It was collected by suction filtration, thoroughly washed with methanol and dried in vacuo.

Yield 0.290 g (44\%).
Anal. Calc.(\%) for $\mathrm{Mn}_{2}\left(\mathrm{C}_{28} \mathrm{H}_{34} \mathrm{~N}_{4} \mathrm{O}_{2}\right)(\mathrm{Cl})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)$ :
C, $51.16 ; \mathrm{H}, 5.52 ; \mathrm{N}, 8.52$.
Found(\%) : C, 50.99 ; H, 5.14 ; N, 8.50.
Solubility : DMSO, DMF, chloroform.
$\Lambda_{\mathrm{M}}($ chloroform $): 0.0 \mathrm{ohm}^{-1} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}$.

## 6) Preparation of mononuclear lanthanide complexes.

The mononuclear lanthanide $\{\operatorname{Pr}(\mathrm{III}), \mathrm{Sm}(\mathrm{III}), \mathrm{Gd}(\mathrm{III})$, and $\mathrm{Dy}(\mathrm{III})\}$ complexes with [2+2] symmetrical $\mathrm{N}_{4} \mathrm{O}_{2}$ compartmental macrocyclic ligand containing bridging phenolic oxygen atoms was synthesized by condensation, in the lathanide ions, of 2,6-diformyl-p-cresol and 2-dimethyl-1,3-propandiamine (Scheme 5).

## (1) $\left[\operatorname{Pr}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right) \mathrm{O}_{2} \mathrm{NO}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot \mathbf{2} \mathbf{H}_{2} \mathrm{O}$.

A solution of 2,6-diformyl-p-cresol $(0.328 \mathrm{~g})$ in the boiling acetonitrile (30 mL ) was dropwise added to the yellow solution formed by mixing 2 , 2-dimethyl-1,3-propandiamine $(0.206 \mathrm{~g})$ with a solution of $\operatorname{Pr}\left(\mathrm{NO}_{3}\right)_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ $(0.435 \mathrm{~g})$ in acetonitrile $(50 \mathrm{~mL})$ 학표 중앙드서관

Scheme 5. Synthesis of the mononuclear lanthanide $\{\operatorname{Pr}(\mathrm{III}), \operatorname{Sm}(\mathrm{III}), \operatorname{Gd}(\mathrm{III})$, and $\mathrm{Dy}(\mathrm{III})\}$ complexes of phenol-based macrocyclic ligand ([22]-HMTADO).

The resulting yellow mixture was stirred at the reflux temperature for 3 h to give an yellow microcrystalline powder. It was collected by suction filtration, thoroughly washed with acetonitrile and dried in vacuo.

Yield 0.642 g (78\%).
Anal. Calc. (\%) for $\operatorname{Pr}\left(\mathrm{C}_{28} \mathrm{H}_{36} \mathrm{~N}_{4} \mathrm{O}_{2}\right)\left(\mathrm{NO}_{3}\right)_{3}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}$ : C, $40.84 ; \mathrm{H}, 4.90$; N, 11.91.

## 3. X-ray Diffraction Measurements

## 1) $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot \mathbf{1 0 H}_{2} \mathrm{O}$

Suitable crystals of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ were obtained by slow evaporation of hot aqueous solution of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)\right] \mathrm{Cl}$ ${ }_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ complex at atmospheric pressure. The dark green crystal of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ was attached to glass fibers and mounted on a Bruker SMART diffractometer equipped with a graphite monochromated $\mathrm{Mo} \mathrm{K} \alpha(=0.71073 \AA$ ) radiation, operating at 50 kV and 30 mA and a CCD detector ; 45 frames of two-dimensional diffraction images were collected and processed to obtain the cell parameters and orientation matrix. The crystallographic data, conditions for the collection of intensity data, and some features of the structure refinements are listed in Table 1, and atomic coordinates were given in Table 2. The intensity data were corrected for Lorentz and polarization effects. Absorption correction was not made during processing. Of the 13200 unique reflections measured, 4935 reflections in the range $2.06^{\circ} \leq 2 \theta \leq 28.29^{\circ}$ were considered to be observed $(I>2 \sigma(I))$ and were used in subsequent structure analysis. The program SAINTPLUS ${ }^{50}$ was used for integration of the diffraction profiles. The structures were solved by direct methods using the SHELXS program of the SHELXTL package ${ }^{51}$ and refined by full matrix least squares against $F^{2}$ for all data using SHELXL. All non-H atoms were refined with anisotropic displacement parameters (Table 3). Hydrogen atoms were placed in idealized
positions $\left[U_{\text {iso }}=1.2 U_{\text {eq }}\right.$ (parent atom)]. Hydrogen coordinates and isotropic displacement parameters were given in Table 4.

Table 1. Crystal data and structure refinement for $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]$
$-\mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$

$R=\sum| | F_{0}\left|-\left|F_{c}\right| / \sum\right| F_{0} \mid, \quad R_{w}=\left[\sum w\left(F_{0}^{2}-F_{c}^{2}\right)^{2} / \sum w\left(F_{0}^{2}\right)^{2}\right]^{1 / 2}$
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}^{2}\right)+(0.0282 P)^{2}+7.1613 P\right]$ where $P=\left(F_{\mathrm{o}}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$.

Table 2. Atomic coordinates ( $\times 10^{4}$ ) and equivalent isotropic displacement parameters $\left(\AA^{2} \mathrm{x}_{1} 10^{3}\right)$ for $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$

## 2) $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$.

Suitable crystals of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$ were obtained by slow evaporation of hot methanol solution of $\left[\mathrm{Cu}_{2}([22]-\right.$ HMTADO $\left.)\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ at atmospheric pressure. The green crystal of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$ was attached to glass fibers and mounted on a Bruker SMART diffractometer equipped with a graphite monochromated $\mathrm{Mo} \mathrm{K} \alpha(=0.71073 \AA$ ) radiation, operating at 50 kV and 30 mA and a CCD detector ; 45 frames of two-dimensional diffraction images were collected and processed to obtain the cell parameters and orientation matrix. The crystallographic data, conditions for the collection of intensity data, and some features of the structure refinements are listed in Table 5, and atomic coordinates were given in Table 6. The intensity data were corrected for Lorentz and polarization effects. Absorption correction was not made during processing. Of the 11949 unique reflections measured, 4537 reflections in the range $1.75^{\circ} \leq 2 \theta \leq 28.26^{\circ}$ were considered to be observed $(I>2 \sigma(I))$ and were used in subsequent structure analysis. The program SAINTPLUS ${ }^{50}$ was used for integration of the diffraction profiles. The structures were solved by direct methods using the SHELXS program of the SHELXTL package ${ }^{51}$ and refined by full matrix least squares against $F^{2}$ for all data using SHELXL. All non-H atoms were refined with anisotropic displacement parameters (Table 7). Hydrogen atoms were placed in idealized positions $\left[U_{\text {iso }}=1.2 U_{\text {eq }}(\right.$ parent atom $\left.)\right]$. Hydrogen coordinates and isotropic displacement parameters were given in Table 8.

Table 5. Crystal data and structure refinement for $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right.$ $\left.-\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}$

$R=\sum| | F_{0}\left|-\left|F_{c}\right|\right| / \sum\left|F_{0}\right|, \quad R_{w}=\left[\sum w\left(F_{0}^{2}-F_{c}^{2}\right)^{2} / \sum w\left(F_{0}^{2}\right)^{2}\right]^{1 / 2}$
$w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.0934 P)^{2}+5.3013 P\right]$ where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$.

## 3) $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot \mathbf{1 0 H}_{2} \mathrm{O}$

Suitable crystals of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ were obtained by slow evaporation of hot aqueous solution of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right] \mathrm{Br}_{2}$. $1.5 \mathrm{H}_{2} \mathrm{O}$ at atmospheric pressure. The dark green crystal of $\left[\mathrm{Cu}_{2}([22]-\right.$ HMTADO) $\left.\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ was attached to glass fibers and mounted on a Bruker SMART diffractometer equipped with a graphite monochromated Mo $\mathrm{K} \alpha(=0.71073 \AA)$ radiation, operating at 50 kV and 30 mA and a CCD detector ; 45 frames of two-dimensional diffraction images were collected and processed to obtain the cell parameters and orientation matrix. The crystallographic data, conditions for the collection of intensity data, and some features of the structure refinements are listed in Table 9, and atomic coordinates were given in Table 10 . The intensity data were corrected for Lorentz and polarization effects. Absorption correction was not made during processing. Of the 13614 unique reflections measured, 5085 reflections in the range $1.48^{\circ} \leq 2 \theta \leq 28.46^{\circ}$ were considered to be observed $(I>2 \sigma(I))$ and were used in subsequent structure analysis. The program SAINTPLUS ${ }^{50}$ was used for integration of the diffraction profiles. The structures were solved by direct methods using the SHELXS program of the SHELXTL package ${ }^{51}$ and refined by full matrix least squares against $F^{2}$ for all data using SHELXL. All non-H atoms were refined with anisotropic displacement parameters (Table 11). Hydrogen atoms were placed in idealized positions $\left[U_{\mathrm{iso}}=1.2 U_{\mathrm{eq}}\right.$ (parent atom)]. Hydrogen coordinates and isotropic displacement parameters were given in Table 12.

Table 9. Crystal data and structure refinement for $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]$ $-\mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$

$R=\sum\left|F_{0}\right|-\left|F_{c}\right| / \sum\left|F_{0}\right|, \quad R_{w}=\left[\sum w\left(F_{0}^{2}-F_{c}^{2}\right)^{2} / \sum w\left(F_{0}^{2}\right)^{2}\right]^{1 / 2}$
$w=1 /\left[\mathrm{\sigma}^{2}\left(F_{\mathrm{o}}^{2}\right)+(0.00475 P)^{2}+1.0787 P\right]$ where $P=\left(F_{\mathrm{o}}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$.

Table 10. Atomic coordinates $\left(\times 10^{4}\right)$ and equivalent isotropic displacement parameters $\left(\AA^{2} \mathrm{x} 10^{3}\right)$ for $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$

$U(\mathrm{eq})$ is defined as one third of the trace of the orthogonalized $U^{\mathrm{ij}}$ tensor.

Table 11. Anisotropic displacement parameters $\left(\AA^{2} \mathrm{x} 10^{3}\right)$ for $\left[\mathrm{Cu}_{2}([22]-\right.$ HMTADO $\left.)\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$

## 4) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 3 \mathbf{H}_{2} \mathrm{O}$.

Crystallization from water formed $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ as good crystals suitable for X-ray crystallography. The pale brown crystal of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ was attached to glass fibers and mounted on a Bruker SMART diffractometer equipped with a graphite monochromated $\mathrm{Mo} \mathrm{K} \alpha(=0.71073 \AA$ ) radiation, operating at 50 kV and 30 mA and a CCD detector ; 45 frames of two-dimensional diffraction images were collected and processed to obtain the cell parameters and orientation matrix. The crystallographic data, conditions for the collection of intensity data, and some features of the structure refinements are listed in Table 13, and atomic coordinates were given in Table 14. The intensity data were corrected for Lorentz and polarization effects. Absorption correction was not made during processing. Of the 24087 unique reflections measured, 8863 reflections in the range $1.83^{\circ} \leq 2 \Theta \leq 28.27^{\circ}$ were considered to be observed $(I>2 \sigma(I))$ and were used in subsequent structure analysis. The program SAINTPLUS ${ }^{50}$ was used for integration of the diffraction profiles. The structures were solved by direct methods using the SHELXS program of the SHELXTL package ${ }^{51}$ and refined by full matrix least squares against $F^{2}$ for all data using SHELXL. All non-H atoms were refined with anisotropic displacement parameters (Table 15). Hydrogen atoms were placed in idealized positions $\left[U_{\text {iso }}=1.2 U_{\text {eq }}(\right.$ parent atom $\left.)\right]$. Hydrogen coordinates and isotropic displacement parameters were given in Table 16.

## 5) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$

Suitable crystals of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ were obtained by slow evaporation of hot aqueous solution of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\right] \mathrm{Br}_{2}$. $1.5 \mathrm{H}_{2} \mathrm{O}$ at atmospheric pressure. The dark green crystal of $\left[\mathrm{Ni}_{2}([22]-\right.$ HMTADO $)\left(\mathrm{OH}_{2}\right)_{4} \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ was attached to glass fibers and mounted on a Bruker SMART diffractometer equipped with a graphite monochromated Mo $\mathrm{K} \alpha(=0.71073 \AA)$ radiation, operating at 50 kV and 30 mA and a CCD detector ; 45 frames of two-dimensional diffraction images were collected and processed to obtain the cell parameters and orientation matrix. The crystallographic data, conditions for the collection of intensity data, and some features of the structure refinements are listed in Table 17, and atomic coordinates were given in Table 18 . The intensity data were corrected for Lorentz and polarization effects. Absorption correction was not made during processing. Of the 12901 unique reflections measured, 4890 reflections in the range $1.50^{\circ} \leq 2 \Theta \leq 28.29^{\circ}$ were considered to be observed $(I>2 \sigma(I))$ and were used in subsequent structure analysis. The program SAINTPLUS ${ }^{50}$ was used for integration of the diffraction profiles. The structures were solved by direct methods using the SHELXS program of the SHELXTL package ${ }^{51}$ and refined by full matrix least squares against $F^{2}$ for all data using SHELXL. All non-H atoms were refined with anisotropic displacement parameters (Table 19). Hydrogen atoms were placed in idealized positions [ $U_{\text {iso }}=1.2 U_{\text {eq }}$ (parent atom)]. Hydrogen coordinates and isotropic displacement parameters were given in Table 20.

## 6) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$.

Crystallization from acetonitrile formed [ $\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)$ ] as good crystals suitable for X-ray crystallography. The pale green crystal of [ $\left.\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$ was attached to glass fibers and mounted on a Bruker SMART diffractometer equipped with a graphite monochromated Mo $\mathrm{K} \alpha(=0.71073 \AA)$ radiation, operating at 50 kV and 30 mA and a CCD detector ; 45 frames of two-dimensional diffraction images were collected and processed to obtain the cell parameters and orientation matrix. The crystallographic data, conditions for the collection of intensity data, and some features of the structure refinements are listed in Table 21, and atomic coordinates were given in Table 22. The intensity data were corrected for Lorentz and polarization effects. Absorption correction was not made during processing. Of the 18991 unique reflections measured, 6954 reflections in the range $1.89^{\circ} \leq 2 \theta \leq 28.26^{\circ}$ were considered to be observed $(I>2 \sigma(I))$ and were used in subsequent structure analysis. The program SAINTPLUS ${ }^{50}$ was used for integration of the diffraction profiles. The structures were solved by direct methods using the SHELXS program of the SHELXTL package ${ }^{51}$ and refined by full matrix least squares against $F^{2}$ for all data using SHELXL. All non-H atoms were refined with anisotropic displacement parameters (Table 23). Hydrogen atoms were placed in idealized positions [ $U_{\text {iso }}=1.2 U_{\mathrm{eq}}$ (parent atom)]. Hydrogen coordinates and isotropic displacement parameters were given in Table 24.

## 7) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left({ }^{\left.\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right] \text {. }}\right.\right.$

Crystallization from hot water formed $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right]$ as good crystals suitable for X-ray crystallography. The pale green crystal of [ $\left.\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right]$ was attached to glass fibers and mounted on a Bruker SMART diffractometer equipped with a graphite monochromated Mo $\mathrm{K} \alpha(=0.71073 \AA)$ radiation, operating at 50 kV and 30 mA and a CCD detector ; 45 frames of two-dimensional diffraction images were collected and processed to obtain the cell parameters and orientation matrix. The crystallographic data, conditions for the collection of intensity data, and some features of the structure refinements are listed in Table 25, and atomic coordinates were given in Table 26. The intensity data were corrected for Lorentz and polarization effects. Absorption correction was not made during processing. Of the 18648 unique reflections measured, 6987 reflections in the range $2.09^{\circ} \leq 2 \Theta \leq 28.29^{\circ}$ were considered to be observed $(I>2 \sigma(I))$ and were used in subsequent structure analysis. The program SAINTPLUS ${ }^{50}$ was used for integration of the diffraction profiles. The structures were solved by direct methods using the SHELXS program of the SHELXTL package ${ }^{51}$ and refined by full matrix least squares against $F^{2}$ for all data using SHELXL. All non-H atoms were refined with anisotropic displacement parameters (Table 27). Hydrogen atoms were placed in idealized positions [ $U_{\text {iso }}=1.2 U_{\text {eq }}$ (parent atom)]. Hydrogen coordinates and isotropic displacement parameters were given in Table 28.

Table 25. Crystal data and structure refinement for $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})(\mu\right.$ $\left.-\mathrm{S}_{2} \mathrm{O}_{3}\right)$ ]

$R=\sum| | F_{0}\left|-\left|F_{c}\right|\right| / \sum\left|F_{0}\right|, \quad R_{w}=\left[\sum w\left(F_{0}^{2}-F_{c}^{2}\right)^{2} / \sum w\left(F_{0}^{2}\right)^{2}\right]^{1 / 2}$
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}^{2}\right)+(0.0428 P)^{2}+1.4855 P\right]$ where $P=\left(F_{\mathrm{o}}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$.

Table 26. Atomic coordinates $\left(\times 10^{4}\right)$ and equivalent isotropic displacement parameters $\left(\AA^{2} \times 10^{3}\right)$ for $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right]$

## 8) $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$.

Crystallization from methanol formed $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]$ $-\left(\mathrm{ClO}_{4}\right)_{2}$ as good crystals suitable for X-ray crystallography. The pale green crystal of $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ was attached to glass fibers and mounted on a Bruker SMART diffractometer equipped with a graphite monochromated $\mathrm{Mo} \mathrm{K} \alpha(=0.71073 \AA$ ) radiation, operating at 50 kV and 30 mA and a CCD detector ; 45 frames of two-dimensional diffraction images were collected and processed to obtain the cell parameters and orientation matrix. The crystallographic data, conditions for the collection of intensity data, and some features of the structure refinements are listed in Table 29, and atomic coordinates were given in Table 30. The intensity data were corrected for Lorentz and polarization effects. Absorption correction was not made during processing. Of the 11147 unique reflections measured, 7790 reflections in the range $1.38^{\circ} \leq 2 \theta \leq 28.33^{\circ}$ were considered to be observed $(I>2 \sigma(I))$ and were used in subsequent structure analysis. The program SAINTPLUS ${ }^{50}$ was used for integration of the diffraction profiles. The structures were solved by direct methods using the SHELXS program of the SHELXTL package ${ }^{51}$ and refined by full matrix least squares against $F^{2}$ for all data using SHELXL. All non-H atoms were refined with anisotropic displacement parameters (Table 31). Hydrogen atoms were placed in idealized positions $\left[U_{\text {iso }}=1.2 U_{\text {eq }}(\right.$ parent atom $\left.)\right]$. Hydrogen coordinates and isotropic displacement parameters were given in Table 32.

Table 29. Crystal data and structure refinement for $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\right.$ $\left.-\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$

## III. Results and Discussion

## 1. Synthesis and characterization of the hexamethyl tetraazadioxa macrocyclic ligand ( $\mathbf{H}_{2}\left[\mathbf{2 2 ]}\right.$-HMTADO - 2 $\mathbf{H C l O}_{4}$ )

The Schiff base condensation of 2,6-diformyl-p-cresol and 2,2-dimethyl-1,3propanediamine in a $1: 1$ mole ratio in ethanol and $\mathrm{HClO}_{4}$ yields the 22membered $\mathrm{N}_{4} \mathrm{O}_{2}$ tetraimine macrocycle $\mathrm{H}_{2}[22]-\mathrm{HMTADO} \cdot 2 \mathrm{HClO}_{4}$ in $83 \%$ yield.

The $400 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR spectrum of the ligand, depicted in Fig. 1, consists of a singlet at 1.268 ppm and 2.117 ppm due to the lattice dimethyl and cresol $\mathrm{CH}_{3}$ protons, respectively., The singlets at 8.594 and 3.879 ppm are due to the azomethine $\mathrm{N}=\mathrm{CH}-$ and propylene $\mathrm{CH}_{2}$ protons, respectively. The singlets at 7.327 and 13.599 ppm are due to the benzene and phenolic protons, respectively. The $100 \mathrm{MHz}{ }^{13} \mathrm{C}$ NMR spectrum of the ligand, depicted in Fig. 2, consists of nine peaks. The infrared spectra of the ligand recorded at room temperature are presented in Fig. 3. Infrared spectra of the ligand show $v(\mathrm{C}=\mathrm{N})$ stretching vibration bands at around $1645 \mathrm{~cm}^{-1}$ and the absence of any carbonyl bands associated with the diformyl-phenol starting materials or nonmarcrocyclic intermediates. The IR spectra displayed C-H stretching vibrations from 3000 to $2800 \mathrm{~cm}^{-1}$. Three C-H deformation bands exhibited at 1440,1390 , and $1370 \mathrm{~cm}^{-1}$ and two weak out-of-plan vibration bands at 815 and $781 \mathrm{~cm}^{-1}$, respectively. The bands of the strong ionic $\mathrm{ClO}_{4}^{-}$ exhibited at near $1090 \mathrm{~cm}^{-1}$ and $624 \mathrm{~cm}^{-1}$. The broad absorption band at
$3429 \mathrm{~cm}^{-1}$ is attributed to $\mathrm{v}(\mathrm{O}-\mathrm{H})$. In the FAB mass spectrum the peak at $\mathrm{m} / \mathrm{z} 461$ corresponds to the molecular ion $\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)^{+}$. The FAB mass spectrum of this ligand is shown in Fig. 4. The UV-Visble spectrum of the free ligand $\mathrm{H}_{2}[22]-H M T A D O$ exhibits four bands at $272 \mathrm{~nm}(\varepsilon=24,238$ $\left.\mathrm{M}^{-1} \mathrm{~cm}^{-1}\right), 349 \mathrm{~nm}\left(\varepsilon=10,490 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right), 433 \mathrm{~nm}\left(\varepsilon=13,990 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$, and 462 $\mathrm{nm}(\mathrm{sh})\left(\varepsilon=8,220 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$ in Fig. 5, which are assigned to the $\pi-\pi^{*}$ and $\mathrm{n}-\pi$ * transitions. Thermogravimetry analysis have been carried out simultaneously for the $\mathrm{H}_{2}[22]-\mathrm{HMTADO} \cdot 2 \mathrm{HClO}_{4}$ ligand (Fig. 6). The result indicate that the macrocycle has relatively high thermal stability. Perchlorate ions are lost in the $275 \sim 347^{\circ} \mathrm{C}$ range. The macrocyclic entity remains unchanged up to $350^{\circ} \mathrm{C}$. Finally, the ligand is wholly decomposed above $678^{\circ} \mathrm{C}$.

## 2. IR spectra of the complexes

## 1) $\mathrm{Cu}($ II) complexes

IR spectra of the $\mathrm{Cu}(\mathrm{II})$ complexes were presented in Fig. $7 \sim 15$. The characteristics of the complexes were listed in Table 33 and 34. The strong and sharp absorption bands occurring at $1635-1640 \mathrm{~cm}^{-1}$ are attributed to $v(\mathrm{C}=\mathrm{N})$ of the coordinated [22]-HMTADO ligand ${ }^{52,53}$, and the absence of any carbonyl bands associated with the diformyl-phenol starting materials or nonmarcrocyclic intermediates. The IR spectra displayed C-H stretching vibrations from 3000 to $2800 \mathrm{~cm}^{-1}$. The present complexes exhibited three C-H deformation bands at 1440,1390 , and $1370 \mathrm{~cm}^{-1}$ regions and two out-of-plan vibration bands at 820 and $765 \mathrm{~cm}^{-1}$ regions. The bands occurring in the IR spectra of the complexes in the $3300-3500 \mathrm{~cm}^{-1}$ regions may probably be due to the $v(\mathrm{OH})$ vibration of the coordinated and/or lattice water. A strong ionic $\mathrm{ClO}_{4}^{-}$band at near $1095 \mathrm{~cm}^{-1}$ and $625 \mathrm{~cm}^{-1}$ in $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ complex.

In metal-cyano complexes, the $\mathrm{C} \equiv \mathrm{N}$ group may act as a terminal or bridging group. Terminal $\mathrm{C} \equiv \mathrm{N}$ groups exhibit a sharp band in the region $2250-2000 \mathrm{~cm}^{-1}$ whereas bridging $\mathrm{C} \equiv \mathrm{N}$ groups absorb near $2130 \mathrm{~cm}^{-1} .{ }^{54}$ Absorption bands are also observed in the ranges of $570-180 \mathrm{~cm}^{-1}$ and $450-295 \mathrm{~cm}^{-1}$. Cyano complexes exhibit bands due to M-C stretching in the region $600-350 \mathrm{~cm}^{-1}$, due to $\mathrm{M}-\mathrm{CN}$ deformation in the region $130-60 \mathrm{~cm}^{-1}$. In aqueous solution, the free $\mathrm{CN}^{-}$ion absorbs near $2080 \mathrm{~cm}^{-1}$ (general range,
$2250-2000 \mathrm{~cm}^{-1}$, covalently bonded cyanide compounds absorb in the region $2250-2170 \mathrm{~cm}^{-1}$ ). The $\mathrm{CN}^{-}$ion may coordinate to a metal atom by $\sigma$ -donation, which increases the frequency of the CN stretching vibration, or by $\pi$-donation from the metal, which reduces the CN stretching frequency. Since $\mathrm{CN}^{-}$is a good $\sigma$-donor and a poor $\pi$-acceptor, the CN stretching frequency generally increases on coordination. The absorption peak at $2116 \mathrm{~cm}^{-1}$ in the $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})(\mathrm{CN})_{2}\right] \cdot 0.5 \mathrm{H}_{2} \mathrm{O}$ is assigned to the stretching frequency of CN .

Thiocyanates ions show several toxic effects towards vertebrates and for the last several years many papers have reported the results of such studies. For example, potassium thiocyanate accelerates the production of large DNA fragments, as well as the induction of trace amounts of internucleosomal DNA cleavage in human peripheral-blood polymorphonuclear leukocytes. ${ }^{55-57}$ The thiocyanate ion may act as an ambidentate ligand, bonding may occur either through the nitrogen or the sulphur atom. The bonding mode may easily be distinguished by examining the band due to the $\mathrm{C}-\mathrm{S}$ stretching vibration which occurs at $730-690 \mathrm{~cm}^{-1}$ when the bonding occurs through the sulphur atom and at $860-780 \mathrm{~cm}^{-1}$ when it is through the nitrogen atom. ${ }^{58}$ The $\mathrm{C} \equiv \mathrm{N}$ stretching vibration of thiocyanato-complexes (sulphur-bound, i.e. M-SCN) gives rise to a sharp band at about $2100 \mathrm{~cm}^{-1}$ and Ga-NCS (i.e. nitrogen bound), the resulting band is often broad and occurs near and below $2050 \mathrm{~cm}^{-1}$. The absorption vibrations due to the N -coordinated bonded $\mathrm{NCS}^{-}$ and ionic $\mathrm{NCS}^{-}$groups in $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})(\mathrm{NCS})\left(\mathrm{OH}_{2}\right)\right] \mathrm{NCS} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ appear 2085-1054 and $820 \mathrm{~cm}^{-1}$.

The coordination chemistry of azido metal complexes has been a revival in
recent years, due to the interest for biologists and bioinorganic chemists investigating the structure and the role of the active site in copper proteins, as well as for physical chemists seeking to design new magnetic materials. ${ }^{59-62}$ In general, for azides the band due to the asymmetric $\mathrm{N}_{3}$ stretching vibration is strong and occurs in the region $2195-2030 \mathrm{~cm}^{-1}$, while that due to the symmetric vibration is much weaker and occurs in the region $1375-1175 \mathrm{~cm}^{-1}$ and the band due to the deformation vibration is also weak and occurs at $680-410 \mathrm{~cm}^{-1} .{ }^{63}$ The absorption peak at $2034 \mathrm{~cm}^{-1}$ in the $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{N}_{3} \cdot \mathrm{H}_{2} \mathrm{O}$ is assigned to the asymmetric stretching mode of coordinated and/or ionic azide. The symmetric stretching frequencies of coordinated and ionic azide are observed at 1329 and 1275 $\mathrm{cm}^{-1}$, respectively. And deformation band of coordinated and/or ionic azide is observed at $635 \mathrm{~cm}^{-1}$. 제주대하교 중앙도서관

The absorption bands of coordinate nitrate occurring in the IR spectra of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO}) \mathrm{ONO}_{2}\right] \mathrm{NO}_{3} \cdot 4 \mathrm{H}_{2} \mathrm{O}$ in the 1442,1325 and $1009 \mathrm{~cm}^{-1}$ regions are assignable to the $v(\mathrm{~N}=\mathrm{O})\left(v_{1}\right), v_{a}\left(\mathrm{NO}_{2}\right) \quad\left(v_{5}\right)$ and $v_{s}\left(\mathrm{NO}_{2}\right) \quad\left(v_{2}\right)$ vibrations, respectively. The absorption band at $1384 \mathrm{~cm}^{-1}$ is characteristic of ionic nitrate present in the outer-coordination sphere. ${ }^{53,64}$

Linkage isomerism is possible in the case of metal complexes containing the unit $\mathrm{NO}_{2}$. Coordination to the metal atom may occur through the nitrogen atom, resulting in a nitro-complex, or through an oxygen atom, resulting in a nitrito-complex. Nitro-complexes exhibit bands due to asymmetric and symmetric $-\mathrm{NO}_{2}$ stretching vibration and, in addition, one due to a $\mathrm{NO}_{2}$ deformation vibration. ${ }^{58}$ The nitrito-complexes exhibit bands due to asymmetric and symmetric -ONO stretching vibrations which are well separated and occur
at $1485-1400 \mathrm{~cm}^{-1}$ and $1110-1050 \mathrm{~cm}^{-1}$, respectively. Nitro-groups in metal coordination complexes may exist as bridging or as end groups. Terminal nitro-groups absorb at $1485-1370 \mathrm{~cm}^{-1}$ and $1340-1315 \mathrm{~cm}^{-1}$ due to the asymmetric and symmetric stretching vibrations of the $\mathrm{NO}_{2}$ group, respectively. ${ }^{58}$ Nitrito-complexes do not have a band near $620 \mathrm{~cm}^{-1}$ which is present for all nitro-complexes. Nitro- groups acting as bridging units between two metal atoms absorb at $1485-1470 \mathrm{~cm}^{-1}$ and at about $1200 \mathrm{~cm}^{-1}$, these bands being broader than those for terminal nitro- groups. The absorption peaks at 1383 and $1325 \mathrm{~cm}^{-1}$ in the $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO}) \mathrm{NO}_{2}\right] \mathrm{NO}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ are assigned to the antisymmetric and symmetric stretching mode of N -bonded $\mathrm{NO}_{2}$, respectively. And deformation band of N -bonded $\mathrm{NO}_{2}$, is observed at 640 $\mathrm{cm}^{-1}$. The absorption band at $1271 \mathrm{~cm}^{-1}$ is characteristic of ionic nitro present in the outer-coordination sphere배학교 중앙도서관

Enzymes that metabolize small molecular compounds of nitrogen and sulfur play an important role in the biosynthesis of amino acids by plants or as a bacterial source of energy. ${ }^{65}$ In particular, interest has grown substantially in microbial sulfur metabolism. The sulfate and thiosulfate ion may coordinate to a metal atom as a unidentate ligand and as a chelating bidentate ligand. Free ion with tetrahedral symmetry, $T_{\mathrm{d}}$, have four fundamental vibrations, only tow of which are infrared active (one stretching mode and bending mode). For unidentate coordination, the symmetry is reduced to $C_{3 v}$, each of the bands for the free ion being split into two bands with, in addition, the two previously only Raman active vibrations now becoming infrared active. Therefore, three bands due to stretching vibrations and three due to bending vibrations are expected. For bidentate coordination, the symmetry is reduced
to $C_{2 \mathrm{v}}$ and each of the bands due to the two modes of vibration of the free ion is now split into three, so that, taking into account the bands which were inactive for the free ion, four bands due to stretching vibrations and four due to bending vibrations are observed. The absorption peaks at 1232-1221 and $1124-1105 \mathrm{~cm}^{-1}$ in the $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO}) \mathrm{S}_{2} \mathrm{O}_{3}\right] \cdot 5 \mathrm{H}_{2} \mathrm{O}$ are assigned to the antisymmetric and symmetric stretching mode of bidentate $\mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-}$, respectively. And deformation bands of bidentate O-bonded $\mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-}$ are observed at 1016, 644 , and $607 \mathrm{~cm}^{-1}$ regions.

## 2) $\mathrm{Ni}($ II) complexes of [22]-HMTADO.

IR spectra of the bi- and mono-nuclear $\mathrm{Ni}(\mathrm{II})$ complexes were presented Fig. $16 \sim 27$, and contain absorption bands characteristic of the complexes (Table 35 and 36). The strong and sharp absorption band occurring at 1630 $1640 \mathrm{~cm}^{-1}$ in the IR spectra of the complexes is attributed to $v(\mathrm{C}=\mathrm{N})$ of the coordinated [22]-HMTADO ligand ${ }^{52,53}$, and the absence of any carbonyl bands associated with the diformyl-phenol starting materials or nonmarcrocyclic intermediates. The IR spectra displayed C-H stretching vibrations from 3000 to $2800 \mathrm{~cm}^{-1}$. The present complexes exhibited three C-H deformation bands at 1440,1390 , and $1370 \mathrm{~cm}^{-1}$ regions and two out-of-plan vibration bands at 820 and $765 \mathrm{~cm}^{-1}$ regions. The absorption bands occurring in the IR spectra of the complexes in the $3300-3500 \mathrm{~cm}^{-1}$ regions may probably be due to the $v(\mathrm{OH})$ vibration of the coordinated and/or lattice water. The absorption peak at $2127 \mathrm{~cm}^{-1}$ in the $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})(\mathrm{CN})_{2}\right] \cdot 0.5 \mathrm{H}_{2} \mathrm{O}$ is assigned to the stretching frequency of CN . The absorption vibrations due to the

N -coordinated bonded $\mathrm{NCS}^{-}$and ionic $\mathrm{NCS}^{-}$groups in [ $\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})$ -(NCS) $\left.)_{2}\left(\mathrm{OH}_{2}\right)\right] \cdot 2 \mathrm{H}_{2} \mathrm{O}$ appear 2060 and $824 \mathrm{~cm}^{-1}$. The absorption peak at $2043 \mathrm{~cm}^{-1}$ in the $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$ is assigned to the anti -symmetric stretching mode of coordinated azide. The symmetric stretching frequency of coordinated azide is observed at $1236 \mathrm{~cm}^{-1}$, and deformation band of coordinated is observed at $621 \mathrm{~cm}^{-1}$. The absorption bands of coordinate nitrate occurring in the IR spectra of [ $\mathrm{Ni}_{2}([22]-H M T A D O)$ $\left.-\left(\mathrm{ONO}_{2}\right)\left(\mathrm{OH}_{2}\right)_{2}\right] \mathrm{NO}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ in the 1437,1331 and $1005 \mathrm{~cm}^{-1}$ regions are assignable to the $v(\mathrm{~N}=\mathrm{O}) \quad\left(v_{1}\right), v_{a}\left(\mathrm{NO}_{2}\right) \quad\left(v_{5}\right)$ and $v_{s}\left(\mathrm{NO}_{2}\right) \quad\left(v_{2}\right)$ vibrations, respectively. The absorption band at $1385 \mathrm{~cm}^{-1}$ is characteristic of ionic nitrate present in the outer-coordination sphere. ${ }^{53,}{ }^{64}$ The absorption peaks at 1333 and $1310 \mathrm{~cm}^{-1}$ in the $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO}) \mathrm{NO}_{2}\right] \mathrm{NO}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ are assigned to the antisymmetric and symmetric stretching mode of N -bonded $\mathrm{NO}_{2}$, respectively. And deformation band of N -bonded $\mathrm{NO}_{2}$, is observed at 617 $\mathrm{cm}^{-1}$. The absorption band at $1285 \mathrm{~cm}^{-1}$ is characteristic of ionic nitro present in the outer-coordination sphere. The $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO}) \mathrm{SO}_{4}\right] \cdot \mathrm{H}_{2} \mathrm{O}$ was obtaind in the reaction of sodium thiosulfate and starting binuclear $\mathrm{Ni}(\mathrm{II})$ macrocyclic complex. The absorption peaks at 1225-1193 and 1121-1093 $\mathrm{cm}^{-1}$ in the $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO}) \mathrm{S}_{2} \mathrm{O}_{3}\right]$ are assigned to the antisymmetric and symmetric stretching mode of bidentate $\mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-}$, respectively. And deformation band of bidentate $\mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-}$ is observed at 1016 , 644 , and $652 \mathrm{~cm}^{-1}$ regions. A strong ionic $\mathrm{ClO}_{4}^{-}$band at near $1090 \mathrm{~cm}^{-1}$ and $625 \mathrm{~cm}^{-1}$ in the $\left[\left[\mathrm{Ni}_{2}([22]-\right.\right.$ HMTADO $\left.)\left(\mathrm{OH}_{2}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ complex.

The absorption peaks at 3323 and $3285 \mathrm{~cm}^{-1}$ in the $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-H M T A D O\right)\right.$
$\left.-\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ are assigned to the $v(\mathrm{OH})$ vibration of the coordinated methanol. The absorption vibrations due to the N -coordinated bonded $\mathrm{NCS}^{-}$ and ionic $\mathrm{NCS}^{-}$groups in $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)(\mathrm{NCS})_{2}\right] \cdot \mathrm{H}_{2} \mathrm{O}$ appear 2098 and $868 \mathrm{~cm}^{-1}$. The absorption peak at $2044 \mathrm{~cm}^{-1}$ in the [ $\mathrm{Ni}\left(\mathrm{H}_{2}[22]\right.$-HMTADO) $\left.-\left(\mathrm{N}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$ is assigned to the antisymmetric stretching mode of coordinated azide. The symmetric stretching frequency of coordinated azide is observed at $1284 \mathrm{~cm}^{-1}$, and deformation band of coordinated is observed at $667 \mathrm{~cm}^{-1}$. And a strong ionic $\mathrm{ClO}_{4}^{-}$band is observed at near $1088 \mathrm{~cm}^{-1}$ and $625 \mathrm{~cm}^{-1}$.

## 3) $\mathbf{M n}$ (II) complex of [22]-HMTADO.

IR spectra of the $\left[\mathrm{Mn}_{2}([22]-\mathrm{HMTADO}) \mathrm{Cl}_{2}\right] \cdot \mathrm{H}_{2} \mathrm{O}$ complex was presented Fig. 28, and contain absorption bands characteristic of the complexes (Table 37). The strong and sharp absorption band occurring at $1632 \mathrm{~cm}^{-1}$ in the IR spectra of the complexes is attributed to $v(\mathrm{C}=\mathrm{N})$ of the coordinated [22]-HMTADO ligand ${ }^{52,53}$, and the absence of any carbonyl bands associated with the diformyl-phenol starting materials or nonmarcrocyclic intermediates. The IR spectra displayed C-H stretching vibrations at 2953 and $2890 \mathrm{~cm}^{-1}$. The present complexes exhibited three C-H deformation bands at 1431, 1400, and $1364 \mathrm{~cm}^{-1}$ regions and two out-of-plan vibration bands at 816 and 771 $\mathrm{cm}^{-1}$ regions. The absorption bands in the $3433 \mathrm{~cm}^{-1}$ region is assigned to the $v(\mathrm{OH})$ vibration of the lattice water. A number of $500 \mathrm{~cm}^{-1}$ region may probably be due to the $\mathrm{Mn}-\mathrm{Cl}$ vibration.

## 4) lanthanide(III) complexes of [22]-HMTADO.

IR spectra of the lanthanide(III) complexes were presented Fig. $29 \sim 32$, and contain absorption bands characteristic of the complexes (Table 37). The strong and sharp absorption band occurring at $1645 \mathrm{~cm}^{-1}$ in the IR spectra of the complexes is attributed to $v(\mathrm{C}=\mathrm{N})$ of the coordinated [22]-HMTADO ligand ${ }^{52,}{ }^{53}$, and the absence of any carbonyl bands associated with the diformyl-phenol starting materials or nonmarcrocyclic intermediates. The IR spectra displayed C-H stretching vibrations from 3000 to $2800 \mathrm{~cm}^{-1}$. The present complexes exhibited three C-H deformation bands at 1478, 1390, and $1317 \mathrm{~cm}^{-1}$ regions and two out-of-plan vibration bands at 825 and $781 \mathrm{~cm}^{-1}$ regions. The absorption bands occurring in the IR spectra of the complexes in the $3430 \mathrm{~cm}^{-1}$ region may probably be due to the $v(\mathrm{OH})$ vibration of the lattice water.

The absorption bands occurring in the IR spectra of the complexes in the 1458-1462, 1283-1285 and $1035-1055 \mathrm{~cm}^{-1}$ regions are assignable to the $v(\mathrm{~N}=\mathrm{O}) \quad\left(v_{1}\right), v_{a}\left(\mathrm{NO}_{2}\right) \quad\left(v_{5}\right)$ and $v_{s}\left(\mathrm{NO}_{2}\right) \quad\left(v_{2}\right)$ vibrations, respectively, of the chelating bidentate nitrate ion. ${ }^{53,64,67}$ The absorption band observed at 815 $\mathrm{cm}^{-1}$ in the complexes is also characteristic of chelating bidentate nitrate. ${ }^{64}$ The larger separation of $177-177 \mathrm{~cm}^{-1}$ between the two higher frequency bands ( $v_{1}$ and $v_{5}$ ) indicates strong interaction of the oxygen atoms of the nitrate with the lanthanide ions and is typical of bidentate coordination. ${ }^{67,68}$ The absorption band at $1385 \mathrm{~cm}^{-1}$ is characteristic of ionic nitrate present in the outer-coordination sphere. ${ }^{64}$

## 3. FAB-mass spectra of the complexes

## 1) $\mathrm{Cu}($ II) complexes

The FAB mass spectra of the $\mathrm{Cu}(\mathrm{II})$ complexes were shown in Fig. $33 \sim 41$, and summarized at Table 38. The FAB mass spectra of all the complexes contain peaks corresponding to the $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right]^{+}$and $[\mathrm{Cu}([22]-$ HMTADO) $]^{+}$ions at $\mathrm{m} / \mathrm{z} 585$ and 522, respectively. These major peaks are associated with peaks of mass one or two greater or less, which are attributed to protonated/deprotonated forms. This also accounts for the slight ambiguities in making assignments. The molecular ions of the $\left[\mathrm{Cu}_{2}([22]-\right.$ HMTADO $\left.) \mathrm{ClO}_{4}\right]^{+},\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO}) \mathrm{NCS}\right]^{+}$, and $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO}) \mathrm{ONO}_{2}\right]^{+}$ are observed at $\mathrm{m} / \mathrm{z} 684.7,643.7$, and 647.7 , respectively. In the mass spectrum of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)\right] \mathrm{Cl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$, the peak observed at $\mathrm{m} / \mathrm{z}$ 620 is due to fragment $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})(\mathrm{Cl})\right]^{+}$. In the mass spectrum of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO}) \mathrm{NO}_{2}\right] \mathrm{NO}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ the peak observed at $\mathrm{m} / \mathrm{z} 675.8$ is due to fragments $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{NO}_{2}\right)_{2}\right]^{+}$. In the mass spectrum of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO}) \mathrm{S}_{2} \mathrm{O}_{3}\right] \cdot 5 \mathrm{H}_{2} \mathrm{O}$ the peak observed at $\mathrm{m} / \mathrm{z} 680.5$ is due to the molecular ion $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO}) \mathrm{SO}_{4}\right]^{+}$, that is, sulfate ion may coordinate to the copper atom. The rearrangement reactions and oxidation by $\mathrm{Fe}^{3+}$ and $\mathrm{O}_{2}$ from thiosulfate to sulfate has been described by Drushel et al. (see Scheme 6). ${ }^{66}$ In the FAB-mass spectrum, this complex is not appeared to vibration bands by thiosulfate ion, but appeared to vibration bands by coordinated sulfate.

Scheme. 6. The rearrangement reactions and oxidation from thiosulfate to sulfate.

## 2) bi- and mono-nuclear $\mathrm{Ni}($ II $)$ complexes

The FAB mass spectra of the binuclear $\mathrm{Ni}(\mathrm{II})$ complexes were shown in Fig. $42 \sim 50$, and summarized at Table 39 . The FAB mass spectra of all the complexes contain peaks corresponding to the $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\right]^{+}$and $[\mathrm{Ni}([22]-\mathrm{HMTADO})]^{+}$ions at $\mathrm{m} / \mathrm{z} 575$ and 517, respectively. These major peaks are associated with peaks of mass one or two greater or less, which are attributed to protonated/deprotonated forms. This also accounts for the slight ambiguities in making assignments. In the mass spectrum of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{2}\right] \mathrm{Cl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$, the peaks observed at $\mathrm{m} / \mathrm{z} 620.7$ and 648.8 are due to fragments $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})(\mathrm{Cl})\right]^{+}$and $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\right.$ $-\left(\mathrm{Cl}_{2}\right]^{+}$, respectively. In the mass spectrum of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{2}\right]$ $-\left(\mathrm{ClO}_{4}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ the peak observed at $\mathrm{m} / \mathrm{z} 675.6$ is due to fragment $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{ClO}_{4}\right)\right]^{+}$. In the mass spectrum of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\right.$ $\left.-(\mathrm{CN})_{2}\right] \cdot 0.5 \mathrm{H}_{2} \mathrm{O}$, the peaks observed at $\mathrm{m} / \mathrm{z} 599.3$ and 618.3 are due to fragments $\quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})(\mathrm{CN})\right]^{+}$and $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})(\mathrm{CN})\left(\mathrm{H}_{2} \mathrm{O}\right)\right]^{+}$,
respectively. In the mass spectrum of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})(\mathrm{NCS})_{2}\left(\mathrm{OH}_{2}\right)\right]$. $2 \mathrm{H}_{2} \mathrm{O}$ the peak observed at $\mathrm{m} / \mathrm{z} 533.7$ is due to fragment $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\right.$ (NCS) $]^{+}$. In the mass spectrum of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$ the peak observed at $\mathrm{m} / \mathrm{z} 618.7$ is due to fragment $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)\right]^{+}$. The molecular ions of the $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO}) \mathrm{NO}_{3}\right]^{+}$and $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO}) \mathrm{NO}_{2}\right]^{+}$ are observed at $\mathrm{m} / \mathrm{z} 635.4$ and 618.5 , respectively. In the mass spectrum of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\right] \mathrm{Br}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ the peak observed at $\mathrm{m} / \mathrm{z} 654.5$ is due to fragment $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO}) \mathrm{Br}\right]^{+}$. In the mass spectrum of $\left[\mathrm{Ni}_{2}([22]-\right.$ HMTADO) $\mathrm{S}_{2} \mathrm{O}_{3}$ ] the peak observed at $\mathrm{m} / \mathrm{z} 616.8$ is due to the molecular ions $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO}) \mathrm{SO}_{4}\right]^{+}$, that is, sulfate ion may coordinate to the nickel atom.

The FAB mass spectra of the mononuclear $\mathrm{Ni}(\mathrm{II})$ complexes were shown in Fig. $51 \sim 53$, and summarized at Table 39 . The FAB mass spectra of all the complexes contain peaks corresponding to the $[\mathrm{Ni}([22]-H M T A D O)]^{+}$ion at $\mathrm{m} / \mathrm{z}$ 516.5. These major peaks are associated with peaks of mass one or two greater or less, which are attributed to protonated/deprotonated forms. This also accounts for the slight ambiguities in making assignments. In the FAB mass spectra of the $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ complex there is an intense peak at $\mathrm{m} / \mathrm{z} 460.8$ corresponding to the species [ $\left.\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right]^{+}$. This indicates that the species $[\mathrm{Ni}([22]-\mathrm{HMTADO})]^{+}$undergoes demetallation to give the tetraazadioxa macrocycle $\mathrm{H}_{2}[22]-\mathrm{HMTADO}$ under FAB conditions.

## 3) $\mathbf{M n}$ (II) complex

The FAB mass spectra of the $\left[\mathrm{Mn}_{2}([22]-\mathrm{HMTADO}) \mathrm{Cl}_{2}\right] \cdot \mathrm{H}_{2} \mathrm{O}$ complex was
shown in Fig. 54, and summarized at Table 40. The FAB mass spectra of the complex contain peaks corresponding to the $\left[\mathrm{Mn}_{2}([22]-\mathrm{HMTADO})+\mathrm{H}\right]^{+}$and $[\mathrm{Mn}([22]-\mathrm{HMTADO})]^{+}$ions at $\mathrm{m} / \mathrm{z} 569$ and 514 , respectively. And there is an intense peak at $\mathrm{m} / \mathrm{z} 461$ corresponding to the species $\left[\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right]^{+}$. This indicates that the species $[\mathrm{Mn}([22]-\mathrm{HMTADO})]^{+}$undergoes demetallation under FAB conditions. The peak observed at $\mathrm{m} / \mathrm{z} 603$ and 659 are due to the fragments $\quad\left[\mathrm{Mn}_{2}([22]-\mathrm{HMTADO}) \mathrm{Cl}\right]^{+}$and $\quad\left[\mathrm{Mn}_{2}([22]-\mathrm{HMTADO})(\mathrm{Cl})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)\right]^{+}$, respectively.

## 4) Lanthanide(III) complexes

The FAB mass spectra of the lanthanide(III) complexes were shown in Fig. $55 \sim 58$, and summarized at Table 40 . The FAB mass spectra of all the complexes contain peaks corresponding to the molecular ion $\left[\operatorname{Ln}\left(\mathrm{H}_{2}[22]-\right.\right.$ HMTADO $\left.)\left(\mathrm{NO}_{3}\right)\right]^{+}$for $\mathrm{Ln}=\operatorname{Pr}^{3+}(\mathrm{m} / \mathrm{z} 661.8), \mathrm{Sm}^{3+}(\mathrm{m} / \mathrm{z} 672.3), \mathrm{Gd}^{3+}(\mathrm{m} / \mathrm{z}$ 677.7) and $\mathrm{Dy}^{3+}(\mathrm{m} / \mathrm{z}$ 683.8). The molecular ion loses the exocyclic nitrate ligand resulting in the formation of the fragment $\left[\operatorname{Ln}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\right]^{+}$. All these species are well observed in the FAB mass spectra. Removal of nitrate ion from the molecular ion is observed with a mass loss of 63 as $\mathrm{HNO}_{3}$. For each metal containing species there is a set of peaks due to the different isotopes of the metal. In the FAB mass spectra of all the complexes there is a peak at $\mathrm{m} / \mathrm{z} 460.8$ corresponding to the species $\left[\mathrm{H}_{2}[22]-H M T A D O\right]^{+}$. This indicates that the species $\left[\operatorname{Ln}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\right]^{+}$undergoes demetallation to give the tetraazadioxa macrocycle $\mathrm{H}_{2}$ [22]-HMTADO under FAB conditions. Peaks corresponding to sandwich complexes of the type $\left[\operatorname{Ln}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)_{2}\right]^{+}$
for $\mathrm{Ln}=\mathrm{Sm}^{3+}\left(\mathrm{m} / \mathrm{z}\right.$ 1069.2), $\mathrm{Gd}^{3+}(\mathrm{m} / \mathrm{z} 1075.7)$ and $\mathrm{Dy}^{3+}(\mathrm{m} / \mathrm{z} 1081.6)$; and $\left[\left\{\mathrm{Ln}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\right\}_{2}\left(\mathrm{NO}_{3}\right)\right]^{+}$for $\mathrm{Ln}=\operatorname{Pr}^{3+}(\mathrm{m} / \mathrm{z}$ 1259.4) are observed in FAB mass spectra. These sandwich complexes might gave been formed during the FAB fragmentation process. ${ }^{53}$

## 4. Electronic absorption spectrum

## 1) $\mathbf{C u}$ (II) complexes

The electronic absorption spectra of $\mathrm{Cu}(\mathrm{II})$ complexes at room temperature were represented in Fig. 59~67 and summarized Table 41. As shown these spectra exhibited one band at $584 \sim 641 \mathrm{~nm}$ due to the ${ }^{2} \mathrm{E}_{\mathrm{g}} \rightarrow{ }^{2} \mathrm{~T}_{2 \mathrm{~g}}\left(O_{\mathrm{h}}\right)$ transitions. The dark green $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right] \mathrm{Cl}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ complex become green in water. The electronic absorption spectrum of this solution are typical of six-coordinate copper(II) complex indicating that species existing in solution is solvated $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]^{2+}$. The symmetry of the octahedron, elongated or squashed along one axis, is $D_{4 \mathrm{~h}}$, exactly that of the square plane. For tetragonal $\mathrm{Cu}^{2+}\left(d^{9}\right)$ complexes the octahedral doublet ${ }^{2} \mathrm{E}_{\mathrm{g}}$ and ${ }^{2} \mathrm{~T}_{2 \mathrm{~g}}$ are seen to split as

$$
\begin{aligned}
& { }^{2} \mathrm{E}_{\mathrm{g}} \rightarrow{ }^{2} \mathrm{~A}_{1 g}+{ }^{2} \mathrm{~B}_{1 g} \\
& { }^{2} \mathrm{~T}_{2 \mathrm{~g}} \rightarrow{ }^{2} \mathrm{E}_{\mathrm{g}}+{ }^{2} \mathrm{~B}_{2 \mathrm{~g}}
\end{aligned}
$$

The relative energies of the tetragonal components depend upon whether the octahedron is elongated or squashed, for ground state of elongated form is ${ }^{2} \mathrm{~B}_{1 \mathrm{~g}}$. ${ }^{69}$ Instead of the single ${ }^{2} \mathrm{E}_{\mathrm{g}} \rightarrow{ }^{2} \mathrm{~T}_{2 \mathrm{~g}}$ transition which occurs for the regular octahedron, the tetragonally distorted molecule will exhibit two transitions ${ }^{2} \mathrm{~B}_{1 \mathrm{~g}} \rightarrow{ }^{2} \mathrm{~B}_{2 \mathrm{~g}}$ and ${ }^{2} \mathrm{~B}_{1 \mathrm{~g}} \rightarrow{ }^{2} \mathrm{E}_{\mathrm{g}}$ at about the octahedral frequency. ${ }^{69}$

A further band at much lower energy is expected from ${ }^{2} \mathrm{~B}_{1 g} \rightarrow{ }^{2} \mathrm{~A}_{1 g}$ transition. ${ }^{69}$

The one $d-d$ band of title complexes observed at $15,600 \sim 17,123 \mathrm{~cm}^{-1}$ can be related to the spin-allowed transition, ${ }^{2} \mathrm{E}_{\mathrm{g}} \rightarrow{ }^{2} \mathrm{~T}_{2 \mathrm{~g}}$. Copper complexes in tetragonal symmetry are expected to have three absorption bands in $d-d$ region, but title spectra apparently have one major component. Thus, we fitted the spectrum roughly with Gaussian functions first and then added a minor component to reproduce the more suitable shape of the spectrum in the region of interest. Finally, we performed least-squares fitting procedures, and the dotted lines in Fig. $59 \sim 66$ are Gaussian bands representing the approximate deconvolution of the spectrum yielded by the calculations. The two peak positions calculated at $14,320-15,117\left(\varepsilon=32-111 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$ and 16,653-17,762 $\mathrm{cm}^{-1}\left(\varepsilon=42-112-\mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$ can be assigned to the ${ }^{2} \mathrm{~B}_{1 \mathrm{~g}} \rightarrow$ ${ }^{2} \mathrm{~B}_{2 \mathrm{~g}}$ and ${ }^{2} \mathrm{~B}_{1 \mathrm{~g}} \rightarrow{ }^{2} \mathrm{E}_{\mathrm{g}}$, respectively. The ${ }^{2} \mathrm{~B}_{1 \mathrm{~g}} \rightarrow{ }^{2} \mathrm{~A}_{1 \mathrm{~g}}$ transition bands have expected at much lower energy. The $23,386-23,929 \mathrm{~cm}^{-1}(\varepsilon=195-313$ $\mathrm{M}^{-1} \mathrm{~cm}^{-1}$ ) bands are clearly associated with ligand to metal charge transfer transitions.

## 2) $\mathbf{N i}($ II $)$ complexes

The electronic absorption spectra of $\mathrm{Ni}($ II ) complexes at room temperature were represented in Fig. 68~79 and summarized Table 42. The pale green crystals of complex $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{2}\right] \mathrm{Cl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ become pale yellow-green in water. The electronic absorption spectrum of this solution is typical of six-coordinate nickel(II) complex indicating that species existing in
solution is $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]^{2+}$. Much weaker bands are found at lower energy, associated with $d-d$ transitions. However, strong absorptions at 300-450 nm are clearly associated with ligand to metal charge transfer transitions, which reflect the presence of highly delocalized $\pi$ marcrocyclic framework. The ground state of $d^{8}$ in an octahedral coordination is ${ }^{3} \mathrm{~A}_{2 \mathrm{~g}}$. Two $d-d$ bands observed for the complex at $13,717 \mathrm{~cm}^{-1}\left(\varepsilon=8.4 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$, $18,051 \mathrm{~cm}^{-1}\left(\varepsilon=19.2 \mathrm{M} \mathrm{cm}^{1}\right)$ can be attributed to the transition in an octahedral model. Thus, these bands may be assigned to the spin allowed transitions ${ }^{3} \mathrm{~A}_{2 g} \rightarrow{ }^{3} \mathrm{~T}_{2 g}(\mathrm{~F})$ and ${ }^{3} \mathrm{~A}_{2 g} \rightarrow{ }^{3} \mathrm{~T}_{1 g}(\mathrm{~F})$, respectively. ${ }^{3} \mathrm{~A}_{2 g} \rightarrow{ }^{3} \mathrm{~T}_{1 g}(\mathrm{P})$ transition is not separated by the transfer effect to visible range of charge transfer transitions and absorptions of marcrocycle ligand.

## 제주대학교 중앙도서관

## 3) $\mathbf{M n}($ II $)$ and Ln (III) complexes

The electronic absorption spectra of $\mathrm{Mn}(\mathrm{II})$ and $\mathrm{Ln}(\mathrm{III})$ complexes at room temperature were represented in Fig. $80 \sim 84$ and summarized Table 43. The absorption band at around $368 \mathrm{~nm}\left(\varepsilon=15,600 \mathrm{M}^{1} \mathrm{~cm}^{-1}\right)$ of Mn (II) complex are associated with ligand to metal charge transfer transitions. All lanthanide complexes exhibit one absorptions at around $398 \mathrm{~nm}(\varepsilon=16,820-18,520$ $\mathrm{M}^{1} \mathrm{~cm}^{-1}$ ) region.

## 5. Thermal stability

## 1) Cu (II) complexes

Thermogravimetry analysis(TGA) have been carried out simultaneously for the $\mathrm{Cu}(\mathrm{II})$ complexes (Fig. $85 \sim 92$ ). Thermogravimetric details were given in Table 44. It was found out from the results that the prepared macrocycle compounds have relatively high thermal stability. The lattice and coordinated water molecules were lost at $\sim 200^{\circ} \mathrm{C}$ range. The exocyclic anions were lost at $200 \sim 350{ }^{\circ} \mathrm{C}$ range. The macrocyclic entity changed slowly up to $350{ }^{\circ} \mathrm{C}$, and then those complexes were changed to CuO .

## 제주대학교 중앙도서관 <br> 2) $\mathbf{N i}($ II) complexes <br> JEJU NATIONAL UNIVERSITY LIBRARY

Thermogravimetry analysis(TGA) have been carried out simultaneously for the $\mathrm{Ni}(\mathrm{II})$ complexes (Fig. $93 \sim 103$ ). Thermogravimetric details were given in Table 44. It was found out from the results that the prepared macrocycle compounds have relatively high thermal stability. The lattice and coordinated water molecules were lost at $\sim 200{ }^{\circ} \mathrm{C}$ range. The exocyclic anions were lost at $270 \sim 350{ }^{\circ} \mathrm{C}$ range. The macrocyclic entity changed slowly up to $350^{\circ} \mathrm{C}$, and then those complexes have been changed to NiO .

## 3) Lanthanide(III) complexes

Thermogravimetry analysis(TGA) have been carried out simultaneously for the lanthanide complexes (Fig. $104 \sim$ 107). Thermogravimetric details were given in Table 46. It was found out from the results that the prepared macrocycle compounds have relatively high thermal stability. The lattice water molecules were lost at $\sim 306^{\circ} \mathrm{C}$ range. The two nitrate ions were lost at 276 $\sim 347^{\circ} \mathrm{C}$ range. The coordinated nitrate ion was lost at $238 \sim 368^{\circ} \mathrm{C}$ range. The macrocyclic entity changed slowly up to $360^{\circ} \mathrm{C}$, and then those complexes have been changed to $\mathrm{M}_{2} \mathrm{O}_{3}\left\{\mathrm{M}=\mathrm{Pr}^{3+}, \mathrm{Sm}^{3+}, \mathrm{Gd}^{3+}\right.$, and $\left.\mathrm{Dy}^{3+}\right\}$.

## 6. Crystal Structures of Complexes.

## 1) $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot \mathbf{1 0 H}_{2} \mathrm{O}$

An ORTEP view of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ is shown in Fig. 108, and bond distances and angles are summarized in Table 47 and 48. The crystal structure of this complex is composed of binuclear cation of the indicated formula and noninteracting chloride anions. These results are backed up by the molar conductivity ( $\Lambda_{M}=218 \mathrm{ohm}^{-1} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}$ ) which agreed with assignment of the structure as $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$. The binuclear cation, $\left[\mathrm{Cu}_{2}([22] \text { - } \mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]^{2+}$ shows two octahedral environment, where the copper(II) ions are coordinated by the two oxygen atoms of water molecules of the copper basal planes $\left(\mathrm{CuN}_{2} \mathrm{O}_{2}\right)$ in trans positions, respectively.

4

The macrocyclic complex adopts an essentially flat structure with the two octahedral copper centers bridged by the two phenoxide oxygen atoms, with quite large $\mathrm{Cu}-\mathrm{O}-\mathrm{Cu}$ angles (102.32(8) ${ }^{\circ}$ and $101.81(7)^{\circ}$ ) (4).

(a)

(b)

Fig. 108. Structural representation of (a) asymmetric unit and (b) core structure (top view) for the $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ complex.

Magnetostructural correlations in binuclear copper(II) complexes bridged equatorially by pairs of hydroxide groups show that the major factor controlling spin coupling between the $S=1 / 2$ metal centers is the $\mathrm{Cu}-\mathrm{O}-\mathrm{Cu}$ angle. The sum of angles at the phenoxide oxygens is almost exactly $360^{\circ}$ $\left(359.71^{\circ}\right)$, indicating no square oxygen distortion. The sum of angles at the copper basal planes $\left(\mathrm{CuN}_{2} \mathrm{O}_{2}\right)$ is almost exactly $360^{\circ}\left(359.97^{\circ}\right)$, indicating no plane distortion.

The copper centers are separated by $3.0482(4) \AA$. The $\mathrm{Cu}-\mathrm{N}$ (imines) bond distances are in the range of $1.9490(15)$ and $1.9503(15) \AA$, and $\mathrm{Cu}-\mathrm{O}$ (phenolic) are $1.9567(11) \AA$ and $1.9638(11) \AA$. The $\mathrm{Cu}-\mathrm{O}$ (aqua) bond distances are in the range of $2.4792(14)$ and $2.5798(14) \AA$. The bond angles $\mathrm{N}(2)-\mathrm{Cu}-\mathrm{O}(1), \mathrm{N}(1)-\mathrm{Cu}-\mathrm{O}(2)$, and $\mathrm{O}(4 \mathrm{~W})-\mathrm{Cu}-\mathrm{O}(3 \mathrm{~W})$ are $169.15(6)^{\circ}, 170.36(6)^{\circ}$ and $172.68(5)^{\circ}$, respectively. $\mathrm{In}-$ this complex $\mathrm{Cu}-\mathrm{N}$ (imines) and $\mathrm{Cu}-\mathrm{O}$ (phenolic) distances are shorter than $\mathrm{Cu}-\mathrm{O}$ (aqua) and the angle $\mathrm{N}(2)-\mathrm{Cu}-\mathrm{O}(1)$, $\mathrm{N}(1)-\mathrm{Cu}-\mathrm{O}(2)$, and $\mathrm{O}(4 \mathrm{~W})-\mathrm{Cu}-\mathrm{O}(3 \mathrm{~W})$ are smaller than the ideal value of $180^{\circ}$, indicating that the donor atoms are not able to achieve the axial positions of a perfect octahedron ; this is elongated owing to the Jahn-Teller effect and steric effect.

Fig. 109. Side view for the $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]^{2+}$ cation.

An angle of $29.61^{\circ}$ exists between the benzene mean planes of macrocycle and the copper basal planes (Fig. 109). This is bent owing to the chair conformation effect of the six-membered ring with trimethylene chain linking the azomethine nitrogen donors and copper. The two methyl groups ( $\mathrm{C}(15)$ and $\mathrm{C}(15 \mathrm{~A})$ ) attached to the trimetylenes are situated eclipsed conformation.

In general, hydrogen bonding plays a principal role in the packing of the title compound. There are four types of H -bonds ; between coordinated waters, coordinated water - lattice water, chloride ion - lattice water, and between lattice waters (Table 49). These interactions result in a formation of polymeric chains (Fig. 110). This chain forms a related layer structure, but within the layers binuclear cation $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]^{2+}$ ions arrange zig-zag configurations.

Fig. 110. The molecular packing diagram of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2}$. $10 \mathrm{H}_{2} \mathrm{O}$. The hydrogen bonds are indicated by dotted lines.

Table 47. Bond lengths ( $\AA$ ) for $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$

## 2) $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$.

An ORTEP representation of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot$ $2 \mathrm{CH}_{3} \mathrm{OH}$ with the atom labels are shown in Fig. 111, and bond distances and angles are summarized in Table 50 and 51. Unfortunately, refinement of structure was hampered due to rather inferior quality of diffraction data and severe disordering of the perchlorate anions. Nevertheless, the structural analysis has elucidated the geometric features and connectivities in the complex molecule. The binuclear cation, $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right]^{2+}$ shows two square pyramidal environment, where the copper(II) ions are coordinated by the two oxygen atoms of perchlorate and water molecules of the copper basal planes $\left(\mathrm{CuN}_{2} \mathrm{O}_{2}\right)$ in trans axis positions, respectively.

5

The macrocyclic complex adopts an essentially flat structure with the two copper centers bridged by the two phenoxide oxygen atoms, with quite large $\mathrm{Cu}-\mathrm{O}-\mathrm{Cu}$ angles (101.14(15) ${ }^{\circ}$ ) (5).

(a)

(b)

Fig. 111. Structural representation of (a) asymmetric unit and (b) core structure (top view) for the $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$ complex.

The sum of angles at the phenoxide oxygens is exactly $360^{\circ}$, indicating no square oxygen distortion.

The copper centers are separated by $3.0319(10) \AA$. The $\mathrm{Cu}-\mathrm{N}$ (imines) bond distances are in the range of $1.945(4)$ and $1.951(4) \AA$, and $\mathrm{Cu}-\mathrm{O}$ (phenolic) are $1.955(3)$ and $1.970(3) \AA$. The $\mathrm{Cu}(1)-\mathrm{O}(4)$ (perchlorate) bond distance is in the range of $2.459(5) \AA$, and the $\mathrm{Cu}(2)-\mathrm{O}(1 \mathrm{w})$ (aqua) bond distance is in the range of $2.335(8) \AA$. The $\mathrm{Cu}(2) \cdots \mathrm{O}(3)$ are separated by 2.701(5) $\AA$. The bond angles $\mathrm{N}(1)-\mathrm{Cu}(1)-\mathrm{O}(1 \mathrm{~A})$ and $\mathrm{N}(2)-\mathrm{Cu}(2)-\mathrm{O}(1 \mathrm{~A})$ are $170.73(14)^{\circ}$ and $168.69(16)^{\circ}$, respectively. The bond angles $\mathrm{O}(1 \mathrm{w})-\mathrm{Cu}(2)-\mathrm{O}(3)$ is $170.1(2)^{\circ}$.

An angle of $29.79^{\circ}$ exists between the benzene mean planes of macrocycle and the copper basal planes (Fig. 112). This is bent owing to the chair conformation effect of the six-membered ring with trimethylene chain linking the azomethine nitrogen donors and copper.

Fig. 112. Side view for the $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right]^{+}$cation.

The two methyl groups $(\mathrm{C}(2)$ and $\mathrm{C}(11)$ ) attached to the trimetylenes are situated eclipsed conformation. The another perchlorate ion and methanol molecules occupy lattice sites. Hydrogen bond not existed in the complex. The binuclear cation $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right]^{+}$ions arrange zig-zag configurations(Fig. 113).

## 3) $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot \mathbf{1 0 H}_{2} \mathbf{O}$

An ORTEP view of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ is shown in Fig. 114, and bond distances and angles are summarized in Table 52 and 53. The crystal structure of this complex is composed of binuclear cation of the indicated formula and noninteracting bromide anions. These results are backed up by the molar conductivity $\left(\Lambda_{M}=160 \mathrm{ohm}^{-1} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}\right)$ which agreed with assignment of the structure as $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$. The binuclear cation, $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]^{2+}$ shows two octahedral environment, where the copper(II) ions are coordinated by the two oxygen atoms of water molecules of the copper basal planes $\left(\mathrm{CuN}_{2} \mathrm{O}_{2}\right)$ in trans positions, respectively.

6

The macrocyclic complex adopts an essentially flat structure with the two octahedral copper centers bridged by the two phenoxide oxygen atoms, with quite large $\mathrm{Cu}-\mathrm{O}-\mathrm{Cu}$ angles $\left(102.17(12)^{\circ}\right.$ and $\left.101.75(12)^{\circ}\right)$ (6). The sum of angles at the phenoxide oxygens is almost exactly $360^{\circ}\left(359.74^{\circ}\right)$, indicating no square oxygen distortion.

(a)

(b)

Fig. 114. Structural representation of (a) asymmetric unit and (b) core structure (top view) for the $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ complex.

The sum of angles at the copper basal planes $\left(\mathrm{CuN}_{2} \mathrm{O}_{2}\right)$ is almost exactly $360^{\circ}\left(359.91^{\circ}\right)$, indicating no plane distortion.

The copper centers are separated by $3.0463(8) \AA$ and in plane copper-ligand distances fall in the range $1.944(2)-1.9635(17) \AA$. An angle of $21.95^{\circ}$ exists between the benzene mean planes of macrocycle and the copper basal planes. This is bent owing to the chair conformation effect of the six-membered ring with trimethylene chain linking the azomethine nitrogen donors and copper. The two methyl groups $(\mathrm{C}(15)$ and $\mathrm{C}(15 \mathrm{~A})$ ) attached to the trimetylenes are situated eclipsed conformation. Two water molecules occupy axial positions in a trans arrangement with somewhat longer contacts $\{\mathrm{Cu}(1)-\mathrm{O}(1 \mathrm{~W}) ; 2.462(2)$ $\AA, \mathrm{Cu}(1)-\mathrm{O}(2 \mathrm{~W}) ; 2.597(2) \AA\}$; this is elongated owing to the Jahn-Teller effect.

In general, hydrogen bonding plays a principal role in the packing of the title compound. There are four types of H-bonds ; between coordinated waters, coordinated water - lattice water, bromide ion - lattice water, and between lattice waters (Table 54). These interactions result in a formation of polymeric chains (Fig. 115). This chain forms a related layer structure, but within the layers binuclear cation $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]^{2+}$ ions arrange zig-zag configurations.

Fig. 115. The molecular packing diagram of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2}$. $10 \mathrm{H}_{2} \mathrm{O}$. The hydrogen bonds are indicated by dotted lines.

Table 52. Bond lengths ( $\AA$ ) for $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$

## 4) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot \mathbf{3 H}_{2} \mathrm{O}$.

An ORTEP view of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ is shown in Fig. 116, and bond distances and angles are summarized in Table 55 and 56. The crystal structure of this complex is composed of binuclear cation of the indicated formula and noninteracting chloride anions. These results are backed up by the molar conductivity ( $\Lambda_{M}=170 \mathrm{ohm}^{-1} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}$ ) which agreed with assignment of the structure as $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 3 \mathrm{H}_{2} \mathrm{O}$. The di -nuclear cation, $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]^{2+}$ shows two octahedral environment, where the nickel(II) ions are coordinated by the two oxygen atoms of water molecules of the nickel basal planes $\left(\mathrm{NiN}_{2} \mathrm{O}_{2}\right)$ in trans positions, respectively.

7

The macrocyclic complex adopts an essentially flat structure with the two octahedral nickel centers bridged by the two phenoxide oxygen atoms, with quite large $\mathrm{Ni}-\mathrm{O}-\mathrm{Ni}$ angles (98.53(6) ${ }^{\circ}$ and $99.50(6)^{\circ}$ ) (7). The sum of angles at the phenoxide oxygens is almost exactly $360^{\circ}\left(359.66^{\circ}\right)$, indicating no square oxygen distortion.

Fig. 116. Structural representation of for the $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ • $3 \mathrm{H}_{2} \mathrm{O}$ complex.

The sum of angles at the nickel basal planes $\left(\mathrm{NiN}_{2} \mathrm{O}_{2}\right)$ is almost exactly $360^{\circ}$ ( $359.96^{\circ}$ and $359.80^{\circ}$ ), indicating no plane distortion.

The nickel centers are separated by $3.0768(4) \AA$ and in plane nickel-ligand
 exists between the benzene mean planes of macrocycle and the nickel basal planes. This is bent owing to the chair conformation effect of the six-membered ring with trimethylene chain linking the azomethine nitrogen donors and nickel.

The two methyl groups $(\mathrm{C}(24)$ and $\mathrm{C}(26))$ attached to the trimetylenes are situated eclipsed conformation. Four water molecules occupy axial positions in a trans arrangement with somewhat longer contacts $\{\mathrm{Ni}(1)-\mathrm{O}(1 \mathrm{~W})$; $2.1271(14) \AA, \mathrm{Ni}(1)-\mathrm{O}(2 \mathrm{~W}) ; 2.1634(14) \AA, \mathrm{Ni}(2)-\mathrm{O}(3 \mathrm{~W}) ; 2.2253(14) \AA$, $\mathrm{Ni}(2)-\mathrm{O}(4 \mathrm{~W}) ; 2.1209(14) \AA$. A . The angles $\mathrm{O}_{\text {axial }}-\mathrm{Ni}-\mathrm{O}_{\text {axial }}\{\mathrm{O}(1 \mathrm{~W})-\mathrm{Ni}(1)-\mathrm{O}(2 \mathrm{~W})$ ; $171.81(6), \mathrm{O}(3 \mathrm{~W})-\mathrm{Ni}(2)-\mathrm{O}(4 \mathrm{~W}) ; 172.61(6)\}$ are smaller than the ideal value of $180^{\circ}$ by hydrogen bonding between coordinated water, indicating that the donor atoms are not able to achieve the axial positions of a perfect octahedron.

In general, hydrogen bonding plays a principal role in the packing of the title compound. There are five types of H -bonds ; between coordinated waters, coordinated water - lattice water, coordinated water - perchlorate ion, lattice water - perchlorate ion, and between lattice waters (Table 57). These interactions result in a formation of polymeric chains (Fig. 117). This chain forms a related layer structure, but within the layers binuclear cation $\left[\mathrm{NI}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]^{2+}$ ions arrange zig-zag configurations.

Fig. 117. The molecular packing diagram of $\left[\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot\right.$
$3 \mathrm{H}_{2} \mathrm{O}$. The hydrogen bonds are indicated by dotted lines.

Table 55. Bond lengths ( $\AA$ ) for $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 3 \mathrm{H}_{2} \mathrm{O}$

## 5) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot \mathbf{1 0 H}_{2} \mathrm{O}$.

An ORTEP view of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ is shown in Fig. 118, and bond distances and angles are summarized in Table 58 and 59. The crystal structure of this complex is composed of binuclear cation of the indicated formula and noninteracting chloride anions. These results are backed up by the molar conductivity ( $\Lambda_{M}=142 \mathrm{ohm}^{-1} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}$ ) which agreed with assignment of the structure as $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$. The binuclear cation, $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]^{2+}$ shows two octahedral environment, where the nickel(II) ions are coordinated by the two oxygen atoms of water molecules of the nickel basal planes $\left(\mathrm{NiN}_{2} \mathrm{O}_{2}\right)$ in trans positions, respectively.

8

The macrocyclic complex adopts an essentially flat structure with the two octahedral nickel centers bridged by the two phenoxide oxygen atoms, with quite large $\mathrm{Ni}-\mathrm{O}-\mathrm{Ni}$ angles $\left(99.66(16)^{\circ}\right.$ and $\left.99.21(16)^{\circ}\right)$ (8). The sum of angles at the phenoxide oxygens is almost exactly $360^{\circ}\left(360.01^{\circ}\right)$, indicating no square oxygen distortion.

(a)

(b)

Fig. 118. Structural representation of (a) asymmetric unit and (b) core structure (top view) for the $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ complex.

The sum of angles at the nickel basal planes $\left(\mathrm{NiN}_{2} \mathrm{O}_{2}\right)$ is exactly $360^{\circ}$, indicating no plane distortion.

The nickel centers are separated by $3.060 \AA$ and in plane nickel-ligand distances fall in the range $1.987(3)-2.009(2) \AA$. An angle of $23.19^{\circ}$ exists between the benzene mean planes of macrocycle and the nickel basal planes. This is bent owing to the chair conformation effect of the six-membered ring with trimethylene chain linking the azomethine nitrogen donors and nickel.

The two methyl groups $(\mathrm{C}(24)$ and $\mathrm{C}(26))$ attached to the trimetylenes are situated eclipsed conformation. Four water molecules occupy axial positions in a trans arrangement with somewhat longer contacts $\{\mathrm{Ni}(1)-\mathrm{O}(1 \mathrm{~W}) ; 2.159(3)$ $\AA, \mathrm{Ni}(1)-\mathrm{O}(2 \mathrm{~W}) ; 2.225(3) \AA$ Á. The angles $\mathrm{O}_{\text {axial }}-\mathrm{Ni}-\mathrm{O}_{\text {axial }}\{\mathrm{O}(1 \mathrm{~W})-\mathrm{Ni}(1)-\mathrm{O}(2 \mathrm{~W})$ ; 172.14(10)\} are smaller than the ideal value of $180^{\circ}$, indicating that the donor atoms are not able to achieve the axial positions of a perfect octahedron.

In general, hydrogen bonding plays a principal role in the packing of the title compound. There are three types of H-bonds ; coordinated water - lattice water, coordinated water - bromide ion, and between lattice waters (Table 60). These interactions result in a formation of polymeric chains (Fig. 119). This chain forms a related layer structure, but within the layers binuclear cation $\left[\mathrm{NI}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]^{2+}$ ions arrange zig-zag configurations.

Fig. 119. The molecular packing diagram of $\left[\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2}\right.$. $3 \mathrm{H}_{2} \mathrm{O}$. The hydrogen bonds are indicated by dotted lines.

## 6) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$.

An ORTEP view of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$ is shown in Fig. 120, and bond distances and angles are summarized in Table 61 and 62. The dinegative ([22]-HMTADO) ${ }^{2-}$ accommodates two $\mathrm{Ni}(\mathrm{II})$ ions in its $\mathrm{N}_{4} \mathrm{O}_{2}$ sites in the $\mathrm{Ni}(1) \cdots \mathrm{Ni}(2)$ separation of $3.115(3)$ Å. The geometry about $\mathrm{Ni}(1)$ in the $\mathrm{N}_{2} \mathrm{O}_{2}$ site is a octahedral with a nitrogen atom of azido and a oxygen atom of aqua in trans positions. And the geometry about $\mathrm{Ni}(2)$ in the $\mathrm{N}_{2} \mathrm{O}_{2}$ site is a square-pyramid with a nitrogen atom of azido at the axial site. The two azido groups coordinated to the nickel centers are situated trans to each other with respect to the mean $\left\{\mathrm{NiN}_{2} \mathrm{O}_{2}\right\}$ plane. These results are backed up by the molar conductivity $\left(\Lambda_{M}=13 \mathrm{ohm}^{-1} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}\right)$ which agreed with assignment of the structure as $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$.

The macrocyclic complex adopts a non-flat structure with the an octahedral and a square-pyramidal nickel centers bridged by the two phenoxide oxygen atoms, with quite large $\mathrm{Ni}-\mathrm{O}-\mathrm{Ni}$ angles (101.21(11) ${ }^{\circ}$ and $\left.100.82(11)^{\circ}\right)$ (9). The sum of angles at the phenoxide oxygens is almost $360^{\circ}\left(359.54^{\circ}\right)$, indicating no square oxygen distortion.

Fig. 120. Structural representation of core structure (top view) for the $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$ complex.

The sum of angles at the octahedral $\mathrm{Ni}(1)$ basal planes $\left(\mathrm{NiN}_{2} \mathrm{O}_{2}\right)$ is exactly $360^{\circ}\left(359.93^{\circ}\right)$, indicating no plane distortion. The $\mathrm{Ni}(1)-\mathrm{N}$ (imines) bond distances are in the range of $2.012(3)$ and $2.013(3) \AA$, and $\mathrm{Ni}(1)-\mathrm{O}$ (phenolic) are $2.021(3)$ and $2.025(3) \AA$. The $\mathrm{Ni}(1)-\mathrm{N}(5)$ (azido) and $\mathrm{Ni}(1)-\mathrm{O}(1 \mathrm{~W})$ (aqua) bond distances are in the range of $2.145(3)$ and $2.161(3) \AA$, respectively. The bond angles of $\mathrm{N}(1)-\mathrm{Ni}(1)-\mathrm{O}(2), \mathrm{N}(4)-\mathrm{Ni}(1)-\mathrm{O}(1)$ and $\mathrm{N}(5)-\mathrm{Ni}(1)-\mathrm{O}(1 \mathrm{~W})$ are $169.86(12)^{\circ}, \quad 170.62(12)^{\circ}$ and $171.76(12)^{\circ}$, respectively. In this complex $\mathrm{Ni}(1)-\mathrm{N}$ (imines) and $\mathrm{Ni}(1)-\mathrm{O}$ (phenolic) distances are shorter than $\mathrm{Ni}(1)-\mathrm{N}(5)$ (azido) and $\mathrm{Ni}(1)-\mathrm{O}(1 \mathrm{~W})$ (aqua) distances and the angle of $\mathrm{N}(1)-\mathrm{Ni}(1)-\mathrm{O}(2)$, $\mathrm{N}(4)-\mathrm{Ni}(1)-\mathrm{O}(1)$ and $\mathrm{N}(5)-\mathrm{Ni}(1)-\mathrm{O}(1 \mathrm{~W})$ are smaller than the ideal value of $180^{\circ}$, indicating that the donor atoms are not able to achieve the axial positions of a perfect octahedron. The $\mathrm{N}_{3}$ ligand keep their linearity, $\mathrm{N}-\mathrm{N}-\mathrm{N}$ bond angle is $179.1(5)^{\circ}$, whereas the $\mathrm{Ni}(1)-\mathrm{N}(5)-\mathrm{N}(6)$ linkage is slightly bent $\left\{120.4(3)^{\circ}\right\}$ towards $\mathrm{Ni}(2)\{\mathrm{Ni}(2) \cdots \mathrm{N}(7) 3.619 \AA\}$. The $\mathrm{Ni}(1)-\mathrm{N}(5)-\mathrm{N}(6)$ basal least-trigonal plane are bent at basal least-trigonal plane for $\mathrm{N}(5)-\mathrm{Ni}(1)-\mathrm{Ni}(2)$ edge with a dihedral angle of $17.87^{\circ}$ towards $\mathrm{O}(2)$-phenolic group.

The sum of angles (356.44 ) at the square-pyramidal $\mathrm{Ni}(2)$ basal planes $\left(\mathrm{NiN}_{2} \mathrm{O}_{2}\right)$ is smaller than the ideal value of $360^{\circ}$, indicating plane distortion. The $\mathrm{Ni}(2)-\mathrm{N}$ (imines) bond distances are in the range of 1.996(3) and $2.019(3) \AA$, and $\mathrm{Ni}(2)-\mathrm{O}$ (phenolic) are $2.010(3) \AA$ and $2.018(3) \AA$. The $\mathrm{Ni}(2)-\mathrm{N}(8)$ (azido) bond distance $\{2.016(3) \AA\}$ is shorter $0.129(3) \AA$ than octahedral $\mathrm{Ni}(1)-\mathrm{N}(5)$ (azido) bond distance $\{2.145(3) \AA\}$. The bond angles $\mathrm{N}(3)-\mathrm{Ni}(2)-\mathrm{O}(1)$ and $\mathrm{N}(2)-\mathrm{Ni}(2)-\mathrm{O}(2)$ are $161.58(12)^{\circ}$ and $164.34(12)^{\circ}$, respectively ; indicating $\mathrm{Ni}(2) \mathrm{N}_{2} \mathrm{O}_{4}$ are not able to the perfect square planer. Result, the $\mathrm{Ni}(2)$ is displaced by $0.320 \AA$ from the basal $\mathrm{N}_{2} \mathrm{O}_{2}$ least-squares
plane towards $\mathrm{N}(8)$ (azido). The $\mathrm{N}_{3}$ ligand keep their linearity, $\mathrm{N}-\mathrm{N}-\mathrm{N}$ bond angle is $177.8(4)^{\circ}$, whereas the $\mathrm{Ni}(2)-\mathrm{N}(8)-\mathrm{N}(9)$ linkage is slightly bent $\left\{121.3(3)^{\circ}\right\}$ towards the opposite $\mathrm{Ni}(1)$ by the repulsion of coordinated aqua of $\mathrm{Ni}(1)$. The $\mathrm{N}_{3}$ ligand adopts the most stereochemically favorable orientation with respect to the macrocycle.

This complex is wholly asymmetric. The $\mathrm{O}(2)$-phenolic groups of macrocycle is bent $18.6^{\circ}$ with the basal $\mathrm{Ni}_{2} \mathrm{O}_{2}$ least-squares plane, whereas $\mathrm{O}(1)$-phenolic groups of macrocycle is flat with the basal $\mathrm{Ni}_{2} \mathrm{O}_{2}$ least-squares plane. Hydrogen bonds are between water and azide molecules of octahedral of neighbor complexes (Fig. 121 and Table 63). And there are a weak $\pi-\pi$ interactions by aromatic ring of neighbor complexes (Fig. 121 (a)) ; a dihedral angle and a distance between aromatic rings are $9.4(2)^{\circ}$ and $4.1 \AA$, respectively.

Fig. 20. The molecular packing diagram of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)\right]$; (a)
the hydrogen bonds and $\pi-\pi$ interactions by aromatic ring of neighbor complexes, (b) cell packing diagram of the complex along $b$ axis.

## 7) $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right]$.

An ORTEP view of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right]$ is shown in Fig. 122, and bond distances and angles are summarized in Table 64 and 65. The dinegative ([22]-HMTADO) ${ }^{2-}$ accommodates two $\mathrm{Ni}(\mathrm{II})$ ions in its $\mathrm{N}_{4} \mathrm{O}_{2}$ sites in the $\mathrm{Ni}(1) \cdots \mathrm{Ni}(2)$ separation of $3.038(2) \AA$. The geometry about two nickel metals in the $\mathrm{N}_{2} \mathrm{O}_{2}$ site are two square-pyramid with a sulfur atom and a oxygen atom of bridged thiosulfate in cis positions. These results are backed up by the molar conductivity $\left(\Lambda_{M}=3.6 \mathrm{ohm}^{-1} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}\right)$ which agreed with assignment of the structure as $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right]$.

10
The macrocyclic complex adopts a non-flat structure with the square-pyramidal nickel centers bridged by the two phenoxide oxygen atoms, with quite large $\mathrm{Ni}-\mathrm{O}-\mathrm{Ni}$ angles $\left(97.80(8)^{\circ}\right.$ and $\left.98.56(9)^{\circ}\right)(10)$. The sum of angles at the phenoxide oxygens is $348.21^{\circ}$, indicating square oxygen distortion.

Fig. 122. Structural representation of core structure (top view) for the $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right]$ complex.

The sum of angles at the octahedral $\mathrm{Ni}(1)$ basal planes $\left(\mathrm{NiN}_{2} \mathrm{O}_{2}\right)$ is exactly $352.39^{\circ}$, indicating plane distortion. The $\mathrm{Ni}(1)-\mathrm{N}$ (imines) bond distances are in the range of $2.004(2)$ and $2.005(2) ~ \AA$, and $\mathrm{Ni}(1)-\mathrm{O}$ (phenolic) are $2.0093(19)$ and $2.024(2) \AA$. The $\mathrm{Ni}(1)-\mathrm{S}(2)$ (thiosulfate) bond distances is in the range of $2.3319(9) \quad \AA$. The bond angles $\mathrm{N}(1)-\mathrm{Ni}(1)-\mathrm{O}(2)$ and $\mathrm{N}(4)-\mathrm{Ni}(1)-\mathrm{O}(1)$ are $157.69(9)^{\circ}$ and $155.37(9)^{\circ}$, respectively. In this complex $\mathrm{Ni}(1)-\mathrm{N}$ (imines) and $\mathrm{Ni}(1)-\mathrm{O}$ (phenolic) distances are shorter than $\mathrm{Ni}(1)-\mathrm{S}(2)$ (thiosulfate) distance and the $\mathrm{N}(1)-\mathrm{Ni}(1)-\mathrm{O}(2)$ and $\mathrm{N}(4)-\mathrm{Ni}(1)-\mathrm{O}(1)$ angles are smaller than the ideal value of $180^{\circ}$, indicating that the donor atoms are not able to achieve the axial positions of a perfect square-pyramidal. Result, the $\mathrm{Ni}(1)$ is displaced by $0.430 \AA$ from the basal $\mathrm{N}_{2} \mathrm{O}_{2}$ least-squares plane towards $\mathrm{S}(2)$ (thiosulfate).

The sum of angles (354.46 ) at the square-pyramidal $\mathrm{Ni}(2)$ basal planes $\left(\mathrm{NiN}_{2} \mathrm{O}_{2}\right)$ is smaller than the ideal value of $360^{\circ}$, indicating plane distortion. The $\mathrm{Ni}(2)-\mathrm{N}$ (imines) bond distances are in the range of 2.000(2) and $2.004(2) \AA$, and $\mathrm{Ni}(2)-\mathrm{O}$ (phenolic) are $1.999(2) \AA$ and $2.000(2) \AA$. The $\mathrm{Ni}(2)-\mathrm{O}(3)$ (thiosulfate) bond distance $\{1.984(2) \AA\}$ is shorter $0.348 \AA$ than octahedral $\mathrm{Ni}(1)-\mathrm{S}(2)$ (thiosulfate) bond distance $\{2.3319(19) \AA\}$. The bond angles $\mathrm{N}(3)-\mathrm{Ni}(2)-\mathrm{O}(1)$ and $\mathrm{N}(2)-\mathrm{Ni}(2)-\mathrm{O}(2)$ are $159.90(9)^{\circ}$ and $159.09(9)^{\circ}$, respectively ; indicating $\mathrm{Ni}(2) \mathrm{N}_{2} \mathrm{O}_{4}$ are not able to the perfect square planer. Result, the $\mathrm{Ni}(2)$ is displaced by $0.350 \AA$ from the basal $\mathrm{N}_{2} \mathrm{O}_{2}$ least-squares plane towards $\mathrm{O}(3)$ (thiosulfate).

This complex is wholly asymmetric. The bridged thiosulfate, tetragonal geometry, slants toward the $\mathrm{Ni}(2)$ and the $\mathrm{O}(2)$-phenolic groups of macrocycle.

## 8) $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$.

An ORTEP view of $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]\right.\right.$-HMTADO $\left.)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ is shown in Fig. 123, and bond distances and angles are summarized in Table 66 and 67. The geometry about $\mathrm{Ni}(1)$ in the $\mathrm{N}_{2} \mathrm{O}_{2}$ site is a octahedral with two oxygen atom of methanol molecule in trans positions, and other $\mathrm{N}_{2} \mathrm{O}_{2}$ site is vacant.

Fig. 123. Structural representation of core structure (top view) for the $\left[\mathrm{Ni}\left(\mathrm{H}_{2}\right.\right.$ [22]-HMTADO) $\left.\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ complex.

The macrocyclic complex adopts a flat structure with the an octahedral nickel center bridged by the two phenoxide oxygen atoms (11). The sum of angles at the octahedral $\mathrm{Ni}(1)$ basal planes $\left(\mathrm{NiN}_{2} \mathrm{O}_{2}\right)$ is exactly $360^{\circ}(360.07$ ${ }^{\circ}$ ), indicating no plane distortion. The $\mathrm{Ni}(1)-\mathrm{N}$ (imines) bond distances are in the range of $2.035(4)$ and $2.052(4) \AA$, and $\mathrm{Ni}(1)-\mathrm{O}$ (phenolic) are $2.009(3)$ and $2.020(3) \AA$. The $\mathrm{Ni}(1)-\mathrm{O}$ (methanol) bond distances are in the range of 2.104(3) and 2.205(3) $\AA$. The bond angles $\mathrm{O}(1)-\mathrm{Ni}(1)-\mathrm{N}(4), \mathrm{O}(2)-\mathrm{Ni}(1)-\mathrm{N}(1)$ and $\mathrm{O}(3)-\mathrm{Ni}(1)-\mathrm{O}(4)$ are $178.05(15)^{\circ}, \quad 174.70(15)^{\circ}$ and $175.20(15)^{\circ}$, respectively. In this complex $\mathrm{Ni}(1)-\mathrm{N}$ (imines) and $\mathrm{Ni}(1)-\mathrm{O}$ (phenolic) distances are shorter than $\mathrm{Ni}(1)-\mathrm{O}$ (methanol) and the angle $\mathrm{O}(1)-\mathrm{Ni}(1)-\mathrm{N}(4)$, $\mathrm{O}(2)-\mathrm{Ni}(1)-\mathrm{N}(1)$ and $\mathrm{O}(3)-\mathrm{Ni}(1)-\mathrm{O}(4)$ are smaller than the ideal value of $180^{\circ}$, indicating that the donor atoms are not able to achieve the axial positions of a perfect octahedron. The dihedral angle between the least-squares plan defined by $\mathrm{Ni}, \mathrm{O}(3)$, and $\mathrm{C}(29)$ and the plane defined by $\mathrm{Ni}, \mathrm{O}(4)$, and $\mathrm{C}(30)$ is $87.47^{\circ}$. This complex is wholly asymmetric. The $\mathrm{O}(1)$-phenolic and $\mathrm{O}(2)$-phenolic groups of macrocycle are bent $35.02^{\circ}$ and $28.46^{\circ}$ with the basal $\mathrm{NiN}_{2} \mathrm{O}_{2}$ least-squares plane, respectively.

In general, hydrogen bonding plays a principal role in the packing of the
title compound. There are three types of H -bonds ; inner macrocycle, macrocyle $-\mathrm{ClO}_{4}^{-}$ion, and coordinated methanol $-\mathrm{ClO}_{4}^{-}$ion (Fig. 124 and Table 68).

Fig. 124. The molecular packing diagram of $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]$ $-\left(\mathrm{ClO}_{4}\right)_{2}$.

Table 68. Selected bond lengths ( $\AA$ ) and angles $\left({ }^{\circ}\right)$ for hydrogen bond of $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$

## IV. Conclusion

The 22-membered phenol-based $\mathrm{N}_{4} \mathrm{O}_{2}$ compartmental macrocycle ligand $\mathrm{H}_{2}[22]$-HMTADO $\left\{5,5,11,17,17,23\right.$-hexamethyl-3,7,15,19-tetraazatricyclo[19,3,1,1 ${ }^{9,13}$ ] -hexacosa-1(25),2,7,9,11,13(26),14,19,21,23-decane-25,26-diol $\} \cdot 2 \mathrm{HClO}_{4}$ derived from the $[2+2]$ cyclic condensation of 2,6-diformyl-p-cresol and 2,2-dimethyl -1,3-propanediamine with $\mathrm{HClO}_{4}$. The macrocycle ligand has relatively high thermal stability.

Binuclear $\{\mathrm{Cu}(\mathrm{II}), \mathrm{Ni}(\mathrm{II})$, and $\mathrm{Mn}(\mathrm{II})\}$ and mononuclear $\{\mathrm{Ni}(\mathrm{II}), \quad \operatorname{Pr}(\mathrm{III})$, $\mathrm{Sm}(\mathrm{III}), \mathrm{Gd}(\mathrm{III})$, and $\mathrm{Dy}(\mathrm{III})\}$ complexes with [2+2] symmetrical $\mathrm{N}_{4} \mathrm{O}_{2}$ compartmental macrocyclic ligand containing bridging phenolic oxygen atoms was synthesized by condensation of 2,6-diformyl-p-cresol and 2-dimethyl-1,3 -propandiamine in the metal ions.

The reaction of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)\right] \mathrm{Cl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ with $\mathrm{L}_{\mathrm{a}}\left(\mathrm{ClO}_{4}{ }^{-}, \mathrm{CN}^{-}\right.$, $\mathrm{NCS}{ }^{-}, \mathrm{N}_{3}{ }^{-}, \mathrm{NO}_{3}{ }^{-}, \mathrm{NO}_{2}{ }^{-}, \mathrm{Br}^{-}$, and $\mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-}$ ) ligands in aqueous solution formed a new $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})(\mathrm{CN})_{2}\right] \cdot$ $0.5 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})(\mathrm{NCS})\left(\mathrm{OH}_{2}\right)\right] \mathrm{NCS} \cdot 2 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right.$ $\left.-\left(\mathrm{N}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{N}_{3} \cdot \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO}) \mathrm{ONO}_{2}\right] \mathrm{NO}_{3} \cdot 4 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right.$ $\left.-\mathrm{NO}_{2}\right] \mathrm{NO}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right] \mathrm{Br}_{2} \cdot 1.5 \mathrm{H}_{2} \mathrm{O}$, and $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right.$ $\left.\mathrm{S}_{2} \mathrm{O}_{3}\right] \cdot 5 \mathrm{H}_{2} \mathrm{O}$ complexes.

The crystals of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ were obtained by slow evaporation of hot aqueous solution of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)\right] \mathrm{Cl}_{2}$. $\mathrm{H}_{2} \mathrm{O}$ complex at atmospheric pressure. The crystal structure of $\left[\mathrm{Cu}_{2}([22]\right.$

- HMTADO ) $\left.\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ is composed of binuclear cation of the indicated formula and noninteracting chloride anions. The binuclear cation, $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]^{2+}$ shows two octahedral environment, where the copper(II) ions are coordinated by the two oxygen atoms of water molecules of the copper basal planes $\left(\mathrm{CuN}_{2} \mathrm{O}_{2}\right)$ in trans positions, respectively. The copper centers are separated by $3.0482(4) \AA$. An angle of $29.61^{\circ}$ exists between the benzene mean planes of macrocycle and the copper basal planes.

The crystals of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$ were obtained by slow evaporation of hot methanol solution of $\left[\mathrm{Cu}_{2}([22]-\right.$ HMTADO $\left.)\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ at atmospheric pressure. The binuclear cation, $\quad\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right]^{2+}$ shows two square pyramidal environment, where the copper(II) ions are coordinated by the two oxygen atoms of perchlorate and water molecules of the copper basal planes $\left(\mathrm{CuN}_{2} \mathrm{O}_{2}\right)$ in axis positions, respectively. The copper centers are separated by $3.0319(10) \AA$. An angle of $29.79^{\circ}$ exists between the benzene mean planes of macrocycle and the copper basal planes.

The crystals of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ were obtained by slow evaporation of hot aqueous solution of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right] \mathrm{Br}_{2} \cdot$ $1.5 \mathrm{H}_{2} \mathrm{O}$ at atmospheric pressure. The crystal structure of $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\right.$ $\left.-\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ is composed of binuclear cation of the indicated formula and noninteracting bromide anions. The binuclear cation, [ $\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})$ $\left.-\left(\mathrm{OH}_{2}\right)_{4}\right]^{2+}$ shows two octahedral environment, where the copper(II) ions are coordinated by the two oxygen atoms of water molecules of the copper basal planes $\left(\mathrm{CuN}_{2} \mathrm{O}_{2}\right)$ in trans positions, respectively. The copper centers are separated by $3.0463(8) \AA$. An angle of $21.95^{\circ}$ exists between the benzene
mean planes of macrocycle and the copper basal planes.
The reaction of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{2}\right] \mathrm{Cl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ with $\mathrm{L}_{\mathrm{a}}\left(\mathrm{ClO}_{4}{ }^{-}, \mathrm{CN}^{-}\right.$, NCS ${ }^{-}, \mathrm{N}_{3}{ }^{-}, \mathrm{NO}_{3}{ }^{-}, \mathrm{NO}_{2}{ }^{-}, \mathrm{Br}^{-}$, and $\mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-}$ ) ligands in aqueous solution formed a new $\quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})(\mathrm{CN})_{2}\right] \cdot$ $0.5 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})(\mathrm{NCS})_{2}\left(\mathrm{OH}_{2}\right)\right] \cdot 2 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\right.$ $\left.-\left(\mathrm{OH}_{2}\right)\right], \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{ONO}_{2}\right)\left(\mathrm{OH}_{2}\right)_{2}\right] \mathrm{NO}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\right.$ $\left.-\mathrm{NO}_{2}\right] \mathrm{NO}_{2} \cdot \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\right] \mathrm{Br}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}, \quad$ and $\quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\right.$ $\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right]$ complexes.

The crystals of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ were obtained by slow evaporation of hot aqueous solution of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{2}\right]$ $-\left(\mathrm{ClO}_{4}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ at atmospheric pressure. The crystal structure of this complex is composed of binuclear cation of the indicated formula and noninteracting chloride anions. The dinuclear cation, $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]^{2+}$ shows two octahedral environment, where the nickel(II) ions are coordinated by the two oxygen atoms of water molecules of the nickel basal planes $\left(\mathrm{NiN}_{2} \mathrm{O}_{2}\right)$ in trans positions, respectively. The nickel centers are separated by 3.0768(4) Å. An angle of $21.07^{\circ}$ exists between the benzene mean planes of macrocycle and the nickel basal planes.

The crystals of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ were obtained by slow evaporation of hot aqueous solution of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\right] \mathrm{Br}_{2} \cdot 1.5 \mathrm{H}_{2} \mathrm{O}$ at atmospheric pressure. The crystal structure of this complex is composed of binuclear cation of the indicated formula and noninteracting chloride anions. The binuclear cation, $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]^{2+}$ shows two octahedral environment, where the nickel(II) ions are coordinated by the two oxygen atoms of water molecules of the nickel basal planes $\left(\mathrm{NiN}_{2} \mathrm{O}_{2}\right)$ in trans
positions, respectively. The nickel centers are separated by $3.060 \AA$. An angle of $23.19^{\circ}$ exists between the benzene mean planes of macrocycle and the nickel basal planes.

The crystals of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$ were obtained by slow evaporation of acetonitrile solution of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$ at atmospheric pressure. The dinegative ([22]-HMTADO) ${ }^{2-}$ accommodates two $\mathrm{Ni}(\mathrm{II})$ ions in its $\mathrm{N}_{4} \mathrm{O}_{2}$ sites in the $\mathrm{Ni}(1) \cdots \mathrm{Ni}(2)$ separation of 3.115(3) Å. The geometry about $\mathrm{Ni}(1)$ in the $\mathrm{N}_{2} \mathrm{O}_{2}$ site is a octahedral with a nitrogen atom of azido and a oxygen atom of aqua in trans positions. And the geometry about $\mathrm{Ni}(2)$ in the $\mathrm{N}_{2} \mathrm{O}_{2}$ site is a square-pyramid with a nitrogen atom of azido at the axial site. The two azido groups coordinated to the nickel centers are situated trans to each other with respect to the mean $\left\{\mathrm{NiN}_{2} \mathrm{O}_{2}\right\}$ plane. The $\mathrm{N}_{3}$ ligand keep their linearity, $\mathrm{N}-\mathrm{N}-\mathrm{N}$ bond angle is $179.1(5)^{\circ}$, whereas the $\mathrm{Ni}(1)-\mathrm{N}(5)-\mathrm{N}(6)$ linkage is slightly bent $\left\{120.4(3)^{\circ}\right\}$ towards $\mathrm{Ni}(2)\{\mathrm{Ni}(2) \cdots \mathrm{N}(7) \quad 3.619 \AA$. The $\mathrm{Ni}(1)-\mathrm{N}(5)-\mathrm{N}(6)$ basal least -trigonal plane are bent at basal least-trigonal plane for $\mathrm{N}(5)-\mathrm{Ni}(1)-\mathrm{Ni}(2)$ edge with a dihedral angle of $17.87^{\circ}$ towards $\mathrm{O}(2)$-phenolic group. The $\mathrm{Ni}(2)$ is displaced by $0.320 \AA$ from the basal $\mathrm{N}_{2} \mathrm{O}_{2}$ least-squares plane towards $\mathrm{N}(8)$ (azido). The $\mathrm{N}_{3}$ ligand keep their linearity, $\mathrm{N}-\mathrm{N}-\mathrm{N}$ bond angle is $177.8(4)^{\circ}$, whereas the $\mathrm{Ni}(2)-\mathrm{N}(8)-\mathrm{N}(9)$ linkage is slightly bent $\left\{121.3(3)^{\circ}\right\}$ towards the opposite $\mathrm{Ni}(1)$ by the repulsion of coordinated aqua of $\mathrm{Ni}(1)$. This complex is wholly asymmetric. The $\mathrm{O}(2)$-phenolic groups of macrocycle is bent $18.6^{\circ}$ with the basal $\mathrm{Ni}_{2} \mathrm{O}_{2}$ least-squares plane, whereas $\mathrm{O}(1)$-phenolic groups of macrocycle is flat with the basal $\mathrm{Ni}_{2} \mathrm{O}_{2}$ least-squares plane. Hydrogen bonds are between water and azide molecules of octahedral of neighbor complexes.

And there are a weak $\pi-\pi$ interactions by aromatic ring of neighbor complexes ; a dihedral angle and a distance between aromatic rings are $9.4(2)^{\circ}$ and $4.1 \AA$, respectively.

The crystals of $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right]$ were obtained by slow evaporation of hot aquose solution at atmospheric pressure. The dinegative ([22]-HMTADO) ${ }^{2-}$ accommodates two $\mathrm{Ni}(\mathrm{II})$ ions in its $\mathrm{N}_{4} \mathrm{O}_{2}$ sites in the $\mathrm{Ni}(1) \cdots \mathrm{Ni}(2)$ separation of $3.038(2)$ Å. The geometry about two nickel metals in the $\mathrm{N}_{2} \mathrm{O}_{2}$ site are two square-pyramid with a sulfur atom and a oxygen atom of bridged thiosulfate in cis positions. The macrocyclic complex adopts a non-flat structure with the square-pyramidal nickel centers bridged by the two phenoxide oxygen atoms. The $\mathrm{Ni}(1)$ is displaced by $0.430 \AA$ from the basal $\mathrm{N}_{2} \mathrm{O}_{2}$ least-squares plane towards $\mathrm{S}(2)$ (thiosulfate). The $\mathrm{Ni}(2)$ is displaced by $0.350 \AA \AA^{\circ}$ from the basal $\mathrm{N}_{2} \mathrm{O}_{2}$ least-squares plane towards $\mathrm{O}(3)$ (thiosulfate). This complex is wholly asymmetric. The bridged thiosulfate, tetragonal geometry, slants toward the $\mathrm{Ni}(2)$ and the $\mathrm{O}(2)$-phenolic groups of macrocycle.

The mononuclear $\mathrm{Ni}(\mathrm{II})$ complex, $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$, was synthesized by condensation of 2,6-diformyl-p-cresol and 2-dimethyl -1,3-propandiamine in nickel perchlorate hexahydrate. The reaction of $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ with $\mathrm{L}_{\mathrm{a}}\left(\mathrm{NCS}^{-}\right.$and $\left.\mathrm{N}_{3}{ }^{-}\right)$ligands in aqueous solution formed a new $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)(\mathrm{NCS})_{2}\right] \cdot \mathrm{H}_{2} \mathrm{O}$ and $\mathrm{Ni}\left(\mathrm{H}_{2}[22]\right.$-HMTADO $\left.)\left(\mathrm{N}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$ complexes.

The crystals of $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ were obtained by slow evaporation of methanol solution at atmospheric pressure. The geometry about $\mathrm{Ni}(1)$ in the $\mathrm{N}_{2} \mathrm{O}_{2}$ site is a octahedral with two oxygen atom of
methanol molecule in trans positions, and other $\mathrm{N}_{2} \mathrm{O}_{2}$ site is vacant. The macrocyclic complex adopts a flat structure with the an octahedral nickel center bridged by the two phenoxide oxygen atoms. The two coordinated methanol molecules dihedral angle between the least-squares plan defined by $\mathrm{Ni}, \mathrm{O}(3)$, and $\mathrm{C}(29)$ and the plane defined by $\mathrm{Ni}, \mathrm{O}(4)$, and $\mathrm{C}(30)$ is $87.47^{\circ}$. This complex is wholly asymmetric. The $O(1)$-phenolic and $O(2)$-phenolic groups of macrocycle are bent $35.02^{\circ}$ and $28.46^{\circ}$ with the basal $\mathrm{NiN}_{2} \mathrm{O}_{2}$ least-squares plane, respectively.

The binonuclear $\mathrm{Mn}(\mathrm{II})$ complex, $\left[\mathrm{Mn}_{2}([22]-\mathrm{HMTADO}) \mathrm{Cl}_{2}\right] \cdot \mathrm{H}_{2} \mathrm{O}$, was synthesized by condensation of 2,6-diformyl-p-cresol and 2-dimethyl-1,3propandiamine in manganese acetate tetrahydrate.

The mononuclear lanthanide complexes, $\left[\operatorname{Pr}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right) \mathrm{O}_{2} \mathrm{NO}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot$ $2 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Sm}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right) \mathrm{O}_{2} \mathrm{NO}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Gd}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right) \mathrm{O}_{2} \mathrm{NO}\right]$ $\left(\mathrm{NO}_{3}\right)_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, and $\left[\mathrm{Dy}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right) \mathrm{O}_{2} \mathrm{NO}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}$, with $[2+2]$ symmetrical $\mathrm{N}_{4} \mathrm{O}_{2}$ compartmental macrocyclic ligand containing bridging phenolic oxygen atoms was synthesized by condensation, in the lathanide ions, of 2,6-diformyl-p-cresol and 2-dimethyl-1,3-propandiamine

## 초 록

22-원 페놀 바탕 $\mathrm{N}_{4} \mathrm{O}_{2}$ 칸막이형 거대고리 리간드 $\mathrm{H}_{2}$ [22]-HMTADO $\left\{5,5,11,17,17,23\right.$-hexamethyl-3,7,15,19-tetraazatricyclo[19,3,1, $\left.1^{9,13}\right]$-hexacosa-1(25),2, $7,9,11,13(26), 14,19,21,23-$ decane-25,26-diol\} $\cdot 2 \mathrm{HClO}_{4}$ 은 $\mathrm{HClO}_{4}$ 존재 하에서 2,6-diformyl-p-cresol와 2,2-dimethyl-1,3-propanediamine의 [2+2] 고리 축합반응으 로부터 합성하였다. 이 거대고리 리간드는 열적으로 안정함을 보였다. 2,6-diformyl-p-cresol와 2,2-dimethyl-1,3-propanediamine의 금속 주형 축합반응을 시켜 페놀의 산소 원가가 다리 결합을 하고 있는 이핵 $\{\mathrm{Cu}(\mathrm{II}), \mathrm{Ni}(\mathrm{II})$, $\mathrm{Mn}(\mathrm{II})\}$ 및 일핵 $\{\mathrm{Ni}(\mathrm{II}), \operatorname{Pr}(\mathrm{III}), \mathrm{Sm}(\mathrm{III}), \mathrm{Gd}(\mathrm{III}), \mathrm{Dy}(\mathrm{III})\}$ 의 [2+2] 22-원 페놀 바탕 $\mathrm{N}_{4} \mathrm{O}_{2}$ 칸막이형 거대고리 착물을 합성하였다. [ $\mathrm{Cu}_{2}$ ([22]-HMTADO) $\left(\mathrm{OH}_{2}\right)$ ] $-\mathrm{Cl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ 을 수용액 하에서 $\mathrm{L}^{-}\left(\mathrm{ClO}_{4}, \mathrm{CN}^{-}, \mathrm{NCS}, \mathrm{N}_{3}^{-}, \mathrm{NO}_{3}^{-}, \mathrm{NO}_{2}^{-}, \mathrm{Br}^{-}\right.$, $\mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-}$ )와 반응시켜 새로운 $\mathrm{Cu}(\mathrm{II})$ 이핵 착물 8 개 합성하였다. [ $\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})$ $\left.-\left(\mathrm{OH}_{2}\right)_{2}\right] \mathrm{Cl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ 을 수용액 하에서 $\mathrm{L}_{\mathrm{a}}\left(\mathrm{ClO}_{4}{ }^{-}, \mathrm{CN}^{-}, \mathrm{NCS}^{-}, \mathrm{N}_{3}{ }^{-}, \mathrm{NO}_{3}{ }^{-}, \mathrm{NO}_{2}{ }^{-}\right.$, $\mathrm{Br}^{-}, \mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-}$ )와 반응시켜 새로운 $\mathrm{Ni}(\mathrm{II})$ 이핵 착물 8 개를 합성하였다. $\mathrm{Ni}\left(\mathrm{ClO}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ 존재 하에서 축합반응을 시킨 결과 일핵 $\mathrm{Ni}(\mathrm{II})$ 착물인 $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ 을 얻을 수 있었고, 이 착물을 $\mathrm{L}_{\mathrm{a}}$ ( $\mathrm{NCS}^{-}$과 $\mathrm{N}_{3}{ }^{-}$) 반응시켜 새로운 $\mathrm{Ni}(\mathrm{II})$ 일핵 착물 2 개를 합성하였다. $\mathrm{Mn}(\mathrm{II})$ 착물인 경우, 이핵의 $\left[\mathrm{Mn}_{2}([22]-\mathrm{HMTADO}) \mathrm{Cl}_{2}\right] \cdot \mathrm{H}_{2} \mathrm{O}$ 착물을 합성하였다. 란 탄족 착물들은 $\quad\left[\mathrm{Ln}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right) \mathrm{O}_{2} \mathrm{NO}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot x \mathrm{H}_{2} \mathrm{O} \quad\{\mathrm{Pr}(\mathrm{III}), \quad \mathrm{Sm}(\mathrm{III})$, $\mathrm{Gd}(\mathrm{III}), \mathrm{Dy}(\mathrm{III})\}$ 형태로 일핵 착물을 형성하였다. 이들 착물들은 원소분석, 전기전도도, UV/Vis, IR 분광법, 질량 분석법, 열중량 분석법 및 X-ray 결정 분석법 등을 이용하여 특성 및 구조적 성질을 확인•고찰하였다. 이 착물들 의 구조 분석 결과, 이핵 착물들의 중심금속은 4 가지 형태의 구조 환경을

갖고 있었다 ; (1) 팔면체 - 팔면체 구조 : $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Cl}_{2}$ • $10 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}, \quad\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)$ $2 \cdot 3 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OH}_{2}\right)_{4}\right] \mathrm{Br}_{2} \cdot 10 \mathrm{H}_{2} \mathrm{O}$, (2) 팔면체 - 사각 피라미드 구조 : $\left[\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{N}_{3}\right)_{2}\left(\mathrm{OH}_{2}\right)\right]$, (3) trans-사각 피라미드 - 사각 피라 미드 구조 : $\left[\mathrm{Cu}_{2}([22]-\mathrm{HMTADO})\left(\mathrm{OClO}_{3}\right)\left(\mathrm{OH}_{2}\right)\right] \mathrm{ClO}_{4} \cdot 2 \mathrm{CH}_{3} \mathrm{OH}$, (4) cis-사각 피라미드 - 사각 피라미드 구조 : [ $\left.\mathrm{Ni}_{2}([22]-\mathrm{HMTADO})\left(\mu-\mathrm{S}_{2} \mathrm{O}_{3}\right)\right]$. 일핵 착물 인 $\left[\mathrm{Ni}\left(\mathrm{H}_{2}[22]-\mathrm{HMTADO}\right)\left(\mathrm{OHCH}_{3}\right)_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ 은 $\mathrm{Ni}(\mathrm{II})$ 중심금속이 팔면체 구조 를 하고 있다. 이들 착물들의 열적 안정성 측정결과 거대고리는 대략 $350{ }^{\circ} \mathrm{C}$ 이상에서 분해가 일어나 열적으로 안정함을 보였다.

## 감 사 의 글

본 논문을 완성하는데 도움을 주신 많은 분들께 이 지면을 통해 감사의 말씀을 드립니다.

이 논문이 완성되기까지 여러모로 부족한 저를 지금까지 이끌어 주신 변종철 교수님께 진심으로 감사드립니다. 그리고 미흡한 논문을 세심하게 다듬어주시고, 깨우침을 주신 정덕상 교수님, 김원형 교수님, 경북대학교 박유철 교수님, 부산대학교 김영인 교수님께 다시 한 번 머리 숙여 감사 드립니다. 또한, 늘 격려해 주시고 용기를 북돋워 주신 한성빈 교수님, 김 덕수 교수님, 강창희 교수님, 이선주 교수님, 이남호 교수님께 깊이 감사 의 말씀을 드립니다. 특히 연구를 수행하는데 있어서 바쁘신 가운데에도 결정분석을 해주신 경상대학교 박기민 교수님께 감사드립니다. 그리고 박 사 과정을 수행하는 동안 여러모로 도움을 주신 자연과학대학 교수님들과 선생님들께도 이 지면를 통해 감사의 말을 드립니다. 앞으로 고마운 분들 앞에서 부끄럽지 않은 모습 보여드리겠습니다.

이 매듭을 짓는데 있어서 가장 큰 도움을 준 무기화학연구실 김구철 박 사님, 문대훈 선생님, 이우환 선생님, 현창식, 김기주, 양동호, 이한나, 설 기선, 김보철, 이승정 학우 및 연구실을 거쳐 간 선후배님들께 감사드리 고, 특히 인천에서 열심히 연구하고 있는 친동생 같은 안창훈 후배님에게 도 감사의 말을 전하고 좋은 성과 거두기를 바랍니다. 또한 제주대학교 화학과 대학원 선후배님들 모두에게 각별한 감사를 드리며, 모두 건승하 시길 바랍니다. 연구를 수행하면서 많은 도움을 준 물리학과, 생명과학과, 식품영양학과 및 제주대학교 대학원 학생회 선후배님들과 벗들에게도 감

사드립니다. 지금껏 살아오는 동안 여러 장소 여러 가지에 걸친 수많은 인연들을 소중하게 생각합니다. 일일이 열거하지 못한 모든 인연들 모두 에게도 감사함을 전합니다.

저를 끝까지 믿어주시고 후원해주신 형, 누나, 매형, 형수님, 처남 식구 들께 감사드립니다. 우리 두 공주님을 사랑으로 돌봐주시고, 항상 친아들 처럼 대해주시는 장모님께 무엇보다도 감사의 말을 드립니다. 어머님, 앞 으로도 훌륭한 사위가 되겠습니다.

묵묵히 옆에서 늘 믿어주고 도와준 아내와 자주 놀아주지 못해 항상 미 안하기만 한 수민, 수진 우리 두 공주님, 아빠가 너희들 앞에서 당당해질 수 있어 얼마나 좋은지 모른다. 사랑한다.

평생을 자식 걱정만 하시는 부모님께 늘 마음이 무거웠습니다. 이 일이 부모님께 작은 기쁨이라도 되기를 간절히 바랍니다. 아버님, 어머님, 사랑 합니다. 그리고 이 논문을 두 분께 바칩니다.
